A QUANTITATIVE CHARACTERISATION OF FUNCTIONS WITH LOW AVILES GIGA ENERGY ON CONVEX DOMAINS

ANDREW LORENT

Abstract. Given a connected Lipschitz domain Ω we let $\Lambda(\Omega)$ be the subset of functions in $W^{2,2}(\Omega)$ with $u = 0$ on $\partial\Omega$ and whose gradient (in the sense of trace) satisfies $\nabla u(x) \cdot \eta_x = 1$ where η_x is the inward pointing unit normal to $\partial\Omega$ at x. The functional $I_\epsilon(u) = \frac{1}{2}\int_\Omega \epsilon^{-1}\left|1-|\nabla u|^2\right|^2 + \epsilon\left|\nabla^2 u\right|^2$ minimised over $\Lambda(\Omega)$ serves as a model in connection with problems in liquid crystals and thin film blisters, it is also the most natural higher order generalisation of the Modica Mortola functional. In [Ja-Ot-Pe 02] Jabin, Otto, Perthame characterised a class of functions which includes all limits of sequences $u_n \in \Lambda(\Omega)$ with $I_{\epsilon_n}(u_n) \to 0$ as $\epsilon_n \to 0$. A corollary to their work is that if there exists such a sequence (u_n) for a bounded domain Ω, then Ω must be a ball and (up to change of sign) $u := \lim_{n\to\infty} u_n = \mathrm{dist}(\cdot, \partial\Omega)$. We prove a quantitative generalisation of this corollary for the class of bounded convex sets.

There exists positive constant γ_1 such that if Ω is a convex set of diameter 2 and $u \in \Lambda(\Omega)$ with $I_\epsilon(u) = \beta$ then $|B_1(x)\triangle\Omega| \leq c\beta^{\gamma_1}$ for some x and

$$\int_\Omega \left|\nabla u(z) + \frac{z-x}{|z-x|}\right|^2 dz \leq c\beta^{\gamma_1}.$$

A corollary of this result is that there exists positive constant $\gamma_2 < \gamma_1$ such that if Ω is convex with diameter 2 and C^2 boundary with curvature bounded by $\epsilon^{-\frac{1}{2}}$, then for any minimiser v of I_ϵ over $\Lambda(\Omega)$,

$$\|v - \zeta\|_{W^{1,2}(\Omega)} \leq c(\epsilon + \inf_y |\Omega\triangle B_1(y)|)^{\gamma_2}$$

where $\zeta(z) = \mathrm{dist}(z, \partial\Omega)$. Neither of the constants γ_1 or γ_2 are optimal.

1. Introduction

We consider the following functional

$$I_\epsilon(u) = \frac{1}{2}\int_\Omega \epsilon^{-1}\left|1-|\nabla u|^2\right|^2 + \epsilon\left|\nabla^2 u\right|^2 \tag{1}$$

the study of which arises from a number of sources, one of the earliest and most important is the article by Aviles, Giga [Av-Gi 87]. We will refer to the quantity $I_\epsilon(u)$ as the Aviles-Giga energy of function u. Functional I_ϵ is usually minimised over the space of functions $u \in W^{2,2}(\Omega)$ where $u(x) = 0$ and $\nabla u(x) \cdot \eta_x = 1$ on $\partial\Omega$ (in the sense of trace) where η_x is the inward pointing unit normal, we will denote this space of functions by $\Lambda(\Omega)$.

Aviles, Giga raised the problem of the study of the limiting behavior of I_ϵ as $\epsilon \to 0$ in connection with the theory of smectic liquid crystals [Av-Gi 87]. In [Gi-Or 97] Gioia, Ortiz studied I_ϵ as a model for thin film blisters. Jin, Kohn [Ji-Ko 00] introduced the by now classic method of estimating the energy by 'divergence of vectorfields'. A related functional arising from micromagnetics was studied by Riviere, Serfaty [Ri-Se 01], in this case the functional acts on vector fields m (in two dimensions) satisfying $|m| = 1$ in Ω and the functional is given by

2000 *Mathematics Subject Classification.* 49N99.
Key words and phrases. Aviles Giga functional.

$M_\epsilon(m) = \epsilon \int_\Omega |\nabla m|^2 + \epsilon^{-1} \int_{\mathbb{R}^2} \left|\nabla^{-1}\text{div}\tilde{m}\right|^2$ where $\tilde{m}$ is vectorfield m extended trivially by 0 outside Ω. For the Aviles Giga functional we minimise over curl free vector fields and the functional forces the norm of the vector field to be 1 with weighting ϵ^{-1} while constraining an ϵ multiple of the L^2 norm (squared) of the gradient, on the other hand the micromagnetics functional is minimised over vectorfields whose norm is taken to be 1 from the outset and the functional forces the vector field to be divergence free with weighting ϵ^{-1} [1] while again constraining an ϵ multiple of the L^2 norm (squared) of the gradient. Functional M_ϵ is much more rigid and very much stronger results are known for it than for I_ϵ, see [Al-Ri-Se 02],[Ri-Se 01],[Am-Ki-Ri 02], [Am-Le-Ri 03].

Roughly speaking, the conjecture is that as $\epsilon \to 0$ the energy of minimisers of I_ϵ will converge to a collection of curves on which the gradient of the minimisers make a jump of order $o(1)$ perpendicularly across the curve. This has already been proved for functional M_ϵ [Ri-Se 01]. A way to think about this is the following, given a connected Lipschitz domain Ω let w be the distance from $\partial\Omega$ and let v_ϵ be w convolved by a convolution kernel of diameter ϵ, the regions where $|\nabla v_\epsilon| \not\sim 1$ will be exactly the ϵ neighborhoods of the curves on which ∇w has a jump discontinuity. If Ω is a ball ∇w will have a discontinuity only at one point, in all other cases there will be non trivial curves of singularities and for the specific function v_ϵ, it is exactly in an ϵ neighborhood of these curves that the energy will concentrate. The conjecture is that what we can observe directly for v_ϵ will hold true for the minimisers of I_ϵ.

The most natural way to study these questions is within the frame work of Γ convergence. One of the earliest successes of Γ convergence was the characterisation of the Γ limit of the so called Modica Mortola functional $A_\epsilon(w) = \int_\Omega \epsilon |\nabla w|^2 + \epsilon^{-1} \left|1 - |w|^2\right|^2$ which is minimised over scalar functions w satisfying an integral condition of the form $\int_\Omega w = 0$. It was shown by Modica, Mortola [Mo-Mo 00] (confirming a conjecture of DeGiorgi) that the Γ limit of A_ϵ is a constant multiple of the H^{n-1} measure of the jump set J_w minimised over the space of functions $w \in \left\{v \in BV : v \in \{1,-1\} \text{ } a.e. \text{ and } \int v = 0\right\}$. Given the elementary inequality

$$\epsilon |\nabla w|^2 + \epsilon^{-1} \left|1 - |w|^2\right|^2 \geq |\nabla w| \left|1 - |w|^2\right| \tag{2}$$

we have that for any sequence (w_n) of equibounded A_{ϵ_n} energy (for some subsequence $\epsilon_n \to 0$) has a uniform L^1 control of $\nabla\left(w_n - \frac{w_n^3}{3}\right)$ and the measure we obtain as the limit of this L^1 sequence of gradients will naturally be supported on the jump set of the limiting function. In some sense the nature of the Γ limit of A_ϵ could be anticipated from (2).

Functional I_ϵ is the most natural higher order generalisation of A_ϵ, in the case of I_ϵ the conjectured Γ limit is surprising, this is part of the reason that functional I_ϵ has received so much attention. The first works on identifying the Γ limit are by Aviles, Giga [Av-Gi 87] and Jin, Kohn [Ji-Ko 00], later these ideas were developed by Ambrosio, DeLellis, Mantegazza [Am-De-Ma 99], roughly speaking the limiting function space is conjectured to have a structure similar to the space of functions whose gradient is BV and the limiting energy is conjectured to have the form $\int_{J_{\nabla u}} |\nabla u^+ - \nabla u^-|^3 \, dH^1$. Much progress has been made on this conjecture, particularly equi-coercivity of I_ϵ has been shown independently in [Am-De-Ma 99] and in the work of Desimone, Kohn, Muller, Otto [De-Ko-Mu-Ot 00]. A proposed limiting function space $AG(\Omega)$ and limiting functional I as been suggested in [Am-De-Ma 99] and it was shown that all limits of sequences of functions (u_n) with $\sup_n I_{\epsilon_n}(u_n) < \infty$ are such that $u_n \overset{W^{1,3}}{\to} u \in AG(\Omega)$ and $\liminf I_{\epsilon_n}(\nabla u_n) \geq I(u)$. The compactness proofs provided by [De-Ko-Mu-Ot 00] and [Am-De-Ma 99] are different but share some common ideas. The proof by [De-Ko-Mu-Ot 00]

[1] the term $\int_{R^2} \left|\nabla^{-1}\text{div}m\right|^2$ is the L^2 norm of the Hodge projection onto curl free vector fields

identifies the set of functions Φ

$$\int |\nabla \Phi(\nabla u)| \leq c \int \left|\nabla^2 u\right| \left|1 - |\nabla u|^2\right| \text{ for any } C^2 \text{ function } u, \tag{3}$$

influenced by ideas of Tartar and Murat on compensated compactness [Ta 79] [Mu 78] the authors are able to prove that this set of Φ is sufficiently rich so as to force ∇u_n to converge strongly. In [Av-Gi 87] the authors (building on work of Jin Kohn [Ji-Ko 00]) found two third order polynomials Σ_1 and Σ_2 such that

$$\int |\mathrm{div}\Sigma_i(\nabla u)| \leq c \int \left|\nabla^2 u\right| \left|1 - |\nabla u|^2\right| \text{ for any } C^2 \text{ function } u, \text{ for } i = 1, 2. \tag{4}$$

Using some elementary and surprising identities satisfied by $\Sigma_1(\nabla u), \Sigma_2(\nabla u)$ a different approach to compactness was found. Rather naturally considering (4), the function space $AG(\Omega)$ proposed by [Am-De-Ma 99] is given by the set of functions v for which $\mathrm{div}(\Sigma_i(\nabla v))$ forms a Radon measure for $i = 1, 2$ and the limiting energy functional $I(v)$ is given by the total absolute value of this measure on Ω.

Given vector field w let $\chi(\xi, w) := 1\!\!1_{\{\xi \cdot w > 0\}}$, Jabin, Perthame [Ja-Pe 97] showed that gradients of sequences of bounded Aviles-Giga energy (in fact their method extends to more general functionals) are compact and the limit ∇u satisfies a kinetic equation of the form $\xi \cdot \nabla_x \chi(\xi, R(\nabla u)) = q$ where q is the distribution derivative with respect to ξ of some measure on $\mathbb{R}^2_\xi \times \mathbb{R}^2_x$ and R is the rotation given by $R(x, y) = (-y, x)$. By application of kinetic averaging lemmas [Di-Li-Me 91] this leads to some regularity; $\nabla u \in W^{s,q}$ for all $0 \leq s < \frac{1}{5}$, $q < \frac{5}{3}$ and using the kinetic equation a different proof of compactness was found. The kinetic equation deduced by [Ja-Pe 97] was motivated by the characterisation of the set of Φ satisfying (3) given in [De-Ko-Mu-Ot 00], indeed defining $\tilde{\Phi}(z) = |z|^2 e$ for $z \cdot e > 0$ and 0 otherwise, in [De-Ko-Mu-Ot 00] it was shown that a sequence Φ_n satisfying (2) could be found that approximates $\tilde{\Phi}$ pointwise. Using the kinetic equation deduced in [Ja-Pe 97], Jabin, Otto, Perthame [Ja-Ot-Pe 02] were able to characterise zero energy limits (and the domains that allow them) for I_ϵ, in fact their result is stronger, they showed that if a divergence free vector field m satisfies the kinetic equation $\xi \cdot \nabla \chi(m, \xi) = 0$, $|m(x)| = 1$ a.e. in Ω and $m(x) \cdot \eta_x = 0$ on $\partial\Omega$ then either Ω is a strip and m is a constant or $\Omega = B_r(x)$ for some $r > 0$, $x \in \mathbb{R}^2$ and $m(z) = \left(\frac{z-x}{|z-x|}\right)^\perp$ or $m(z) = -\left(\frac{z-x}{|z-x|}\right)^\perp$. An analogous result for zero energy limits of M_ϵ is stated in [Le-Ri 02] and is a consequence of the main theorem of [Am-Le-Ri 03].

As a corollary, given a sequence $u_n \in \Lambda(\Omega)$ and $\epsilon_n \to 0$ such that $I_{\epsilon_n}(u_n) \to 0$ as $n \to \infty$, letting u be the limit of this sequence, the vector field $R(\nabla u)$ satisfies the hypothesis stated and hence we have (up to a sign) a complete description of ∇u.

The main theorem of this paper is a quantitative generalisation of the corollary to Jabin, Otto, Perthame theorem over the class of bounded convex sets.

Theorem 1. *Let $\epsilon > 0$ and Ω be a convex domain with diameter 2. Let $u \in W^{2,2}(\Omega)$ with $u = 0$ on $\partial\Omega$ and $\nabla u(x) \cdot \eta_x = 1$ of $\partial\Omega$ (in the sense of trace) where η_x is the inward pointing unit normal. Then there exists positive constants $\mathcal{C} > 1$ and $\gamma < 1$ such that for some $x \in \Omega$,*

$$|\Omega \triangle B_1(x)| \leq \mathcal{C} \left(I_\epsilon(u)\right)^\gamma$$

and

$$\int_\Omega \left|\nabla u(z) + \frac{z - x}{|z - x|}\right|^2 dz \leq \mathcal{C} \left(I_\epsilon(u)\right)^\gamma.$$

Corollary 1. *Let Ω be a convex set with diameter 2, C^2 boundary and curvature bounded above by $\epsilon^{-\frac{1}{2}}$. Let $\Lambda(\Omega) := \left\{u \in W^{2,2}(\Omega) : u = 0 \text{ on } \partial\Omega \text{ and } \nabla u(z) \cdot \eta_z = 1 \text{ for } z \in \partial\Omega\right\}$. There exists positive constants $\mathcal{C} > 1$ and $\lambda < 1$ such that if u is a minimiser of I_ϵ over $\Lambda(\Omega)$, then*

$$\|u - \zeta\|_{W^{1,2}(\Omega)} \leq \mathcal{C}\left(\epsilon + \inf_y |\Omega \triangle B_1(y)|\right)^\lambda \tag{5}$$

where $\zeta(z) = \text{dist}(z, \partial\Omega)$.

In Theorem 1 we take $\gamma = 512^{-1}$ and in Corollary 1, $\lambda = 3000^{-1}$. Neither constant is optimal.

1.1. **Background.** Given a sequence $\epsilon_n \to 0$ and $u_n \in \Lambda(\Omega)$ with $\limsup I_{\epsilon_n}(u_n) < \infty$, let u be the limit of u_n, the vector valued measure given by $\nu_u := (\text{div}\Sigma_1(\nabla u), \text{div}\Sigma_2(\nabla u))$ (where Σ_1, Σ_2 are the third order polynomials that satisfy (4)) gives us the expression of the limiting energy, i.e. $I(u) = \|\nu_u\|(\Omega)$. If we consider the 1-dimensional part of the measure

$$\Gamma := \left\{x : \limsup_{r \to 0} \frac{\|\nu_u(B_r(x))\|}{r} > 0\right\}$$

it has been shown that Γ is 1-rectifiable [De-Ot 03] (see also [De-Ot-We 03]) and an analogous result has been shown for M_ϵ [Am-Ki-Ri 02]. It was also shown ∇u has jump discontinuities across the rectifiable set Γ exactly as would be the case if ∇u was BV and its jump set was given by Γ. However it is not known (even if u_n are the minimisers of I_{ϵ_n}) if measure $\|\nu_u\|$ is even singular with respect to Lebesgue measure. Note that for the function M_ϵ the minimiser of the limiting energy is known to be rectifiable [Am-Le-Ri 03], for a sequence with only equibounded energy the measure is not known to be singular.

The original motivation for Theorem 1 was to prove a version of it for $\Omega = B_1(0)$ without boundary conditions, under the hypotheses $\int_{B_1}\left|1 - |\nabla u|^2\right|\left|\nabla^2 u\right| = \beta$, $\int_{B_1}\left|1 - |\nabla u|^2\right| \leq \epsilon$ and $\sup\left\{\|u - A\|_{L^\infty(B_1(0))} : A \text{ is affine with } |\nabla A| = 1\right\} \leq 1000^{-1}$, the conclusion in this case would be that there exists a smooth function ψ with $|\nabla\psi| = 1$ everywhere such that $\|\nabla u - \nabla\psi\|_{L^2\left(B_{2^{-1}}(0)\right)} \leq c\beta^\gamma$ for some $\gamma > 0$. This is a kind of quantitative version of the main proposition required to prove compactness in [Am-De-Ma 99], (see Proposition 4.6). The hope is to use such a quantitative result to show $\|\nu_u\|$ is singular, or at least that ∇u is continuous at H^1 a.e. point outside Γ, we will address these issues in a forthcoming paper [Lo pr].

The many strong results about measure $\|\nu_u\|$ (and the measure that gives the limiting functional for the micromagnetics function) have been achieved by characterising various kinds of *blow up* of the measure and understanding well the absolute (i.e. non quantitative) situation in the limit [Am-Ki-Ri 02], [De-Ot 03], [De-Ot-We 03], [Ja-Ot-Pe 02], [Am-Le-Ri 03]. In some sense there are only two possibilities, to take a limit and have an absolute situation and to understand the measure from this, or to stop before the limit and have a non-absolute situation and try and understand something about it with a quantitative theorem. Our primary motivation in proving a quantitative version of Jabin-Otto-Perthame Theorem was so as to obtain a result that could be used for the latter approach.

By Poincare's inequality it is easy to see $\inf_{\Lambda(\Omega)} I_\epsilon \geq c\epsilon$ and so Theorem 1 follows from the following slightly more general result.

Theorem 2. *Let Ω be a convex body centered on 0 with $\text{diam}(\Omega) = 2$. Let $\beta > 0$, suppose $u : W^{2,2}(\Omega) \to \mathbb{R}$ is a function satisfying*

$$\int_\Omega \left|1 - |\nabla u|^2\right|\left|\nabla^2 u\right| dz \leq \beta \tag{6}$$

and

$$\int_\Omega \left|1-|\nabla u|^2\right|^2 dz \leq \beta^2 \tag{7}$$

and in addition u satisfies $u=0$ on $\partial\Omega$ and $\nabla u(z)\cdot\eta_z = 1$ on $\partial\Omega$ in the sense of trace where η_z is the inward pointing unit normal to $\partial\Omega$ at z.

Then there exists positive constant $\mathcal{C}_1>0$ such that $|B_1(0)\triangle\Omega|<\mathcal{C}_1\beta^{\frac{1}{256}}$ and

$$\int_\Omega \left|\nabla u(z)+\frac{z}{|z|}\right|^2 dz \leq \mathcal{C}_1\beta^{\frac{1}{256}}. \tag{8}$$

2. Sketch of the proof

2.1. **Sketch of the proof of Theorem 2.** While the proof for convex domains is slightly involved, there are only a couple of ideas that are really central. We will sketch the proof for the case $\Omega = B_1(0)$, ignoring (without comment) many technicalities in order to give an impression of the basic skeleton.

The real engine of the proof is the characterisation in [De-Ko-Mu-Ot 00] of the set of Φ such that (3) is satisfied. As mentioned in the introduction, as consequence of the characterisation it was shown there exists a sequence of Φ_n satisfying (3) that converge pointwise to the function $\tilde{\Phi}(z)=|z|^2 e$ for $z\cdot e>0$ and 0 otherwise. Following closely the proof of this it is possible to extract the existence of functions Φ_θ and Ψ_θ with $\|\nabla\Phi_\theta\|\leq c\beta^{-\frac{1}{4}}$, $\|\Psi_\theta\|\leq c\beta^{-\frac{1}{4}}$, $\|\nabla\Psi_\theta\|\leq c\beta^{-\frac{1}{2}}$ such that the following two inequalities hold.

Let $\Lambda_\theta(z):=\theta$ for $z\cdot\theta>0$ and 0 otherwise,

$$|\Phi_\theta(z)-\Lambda_\theta(z)|\leq c\beta^{\frac{1}{4}} \text{ for } z\in N_{\sqrt{\beta}}(S^1)\backslash B_{2\beta^{\frac{1}{4}}}(\theta) \tag{9}$$

and (letting $R(z_1,z_2)=(-z_2,z_1)$ be the anti-clockwise rotation)

$$\operatorname{div}\left[\Phi_\theta(R(\nabla w))-\Psi_\theta(R(\nabla w))\left(1-|R(\nabla w)|^2\right)\right]\leq c\beta^{-\frac{1}{2}}\left|1-|\nabla w|^2\right|\left|\nabla^2 w\right| \text{ for any } w\in W^{2,1}. \tag{10}$$

Recall, for simplicity we have taken $\Omega=B_1(0)$, as $\nabla u(z)=-\frac{z}{|z|}$ on $\partial B_1(0)$ then we can extend u to a function $\tilde{u}: B_{11/10}(0)\to\mathbb{R}$ such that

$$\int_{B_{11/10}(0)}\left|1-|\nabla\tilde{u}|^2\right|\left|\nabla^2\tilde{u}\right|\leq c\beta, \int_{B_{11/10}(0)}\left|1-|\nabla\tilde{u}|^2\right|^2\leq c\beta^2$$

and

$$\nabla\tilde{u}(z)=-\frac{z}{|z|} \text{ for any } z\in B_{11/10}(0). \tag{11}$$

It is more convenient to work with vectorfields that are *almost* curl free instead of *almost* divergence free. So notice that (9) can be rewritten as

$$|R(\Phi_\theta(z))-R(\Lambda_\theta(z))|\leq c\beta^{\frac{1}{4}} \text{ for } z\in N_{\sqrt{\beta}}(S^1)\backslash B_{2\beta^{\frac{1}{4}}}(\theta) \tag{12}$$

and we have $\int_{B_{11/10}(0)}\left|\operatorname{curl}\left[R(\Phi_\theta(R(\nabla\tilde{u})))-R(\Psi_\theta(R(\nabla\tilde{u})))\left(1-|\nabla\tilde{u}|^2\right)\right]\right|\leq c\sqrt{\beta}$. By the quantitative Hodge decomposition type theorem from [Am-De-Ma 99] (Theorem 4.3) we can find a scalar valued function w_θ such that

$$\int_{B_{11/10}(0)}\left|\nabla w_\theta-\left(R(\Phi_\theta(R(\nabla\tilde{u})))-R(\Psi_\theta(\nabla R(\nabla\tilde{u})))\left(1-|\nabla\tilde{u}|^2\right)\right)\right|\leq c\sqrt{\beta}. \tag{13}$$

The real power of (13) is that on the annulus $\mathcal{A} := B_{11/10}(0)\backslash B_1(0)$ we know that $\nabla\tilde{u}(z) = -\frac{z}{|z|}$ and hence given inequality (12) (and the fact that $|\nabla\tilde{u}| = 1$ on $\mathcal{A}$) we have a that $\Phi_\theta\left(R\left(\nabla\tilde{u}(z)\right)\right) \in N_{\beta^{\frac{1}{4}}}\left(\theta\right)$ for any $z \in \mathcal{A} \cap H\left(R\theta, 0\right)$, see figure 1.

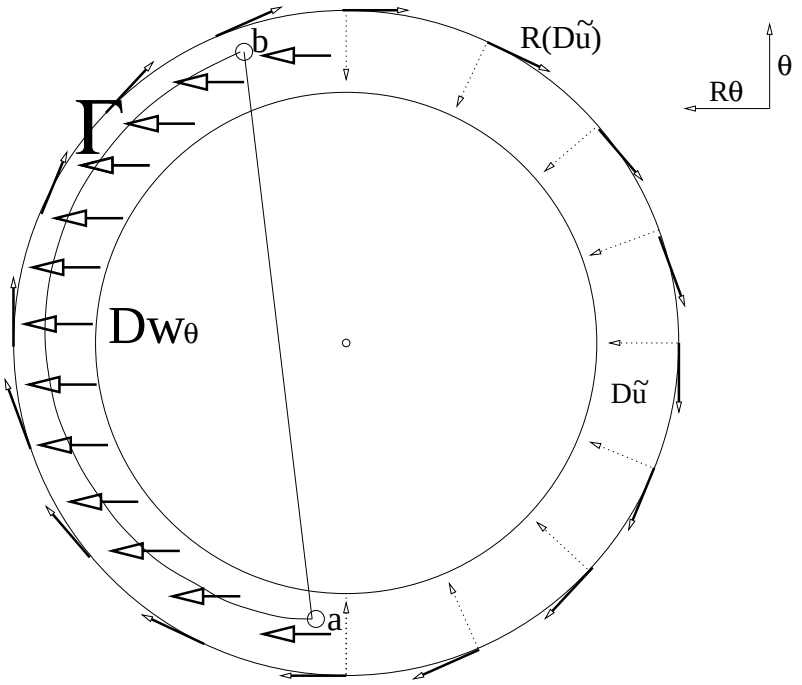

FIGURE 1.

In much the same way in the ball $B_1(0)$, by inequalities (12), (13) and $\int_{B_1(0)} \left|1 - |\nabla\tilde{u}|^2\right|^2 \leq \beta^2$ we have that there exists a large set $\mathcal{G} \subset B_1(0) \cap H(0, R\theta)$, with $|B_1(0)\backslash\mathcal{G}| \leq \sqrt{\beta}$ such that if $z \in \mathcal{G}$ then $\nabla w_\theta(z) \in B_{\beta^{\frac{1}{4}}}(R\theta)$ or $\nabla w_\theta(z) \in B_{\beta^{\frac{1}{4}}}(0)$ depending on whether $R(\nabla u(z)) \cdot \theta > 0$ or $R(\nabla u(z)) \cdot \theta \leq 0$.

It is not hard to see we can find points $a, b \in N_{\beta^{\frac{1}{8}}}(\langle\theta\rangle \cap \partial B_1(0))$ with $|a - b| \sim 2$, $\theta \cdot \frac{b-a}{|b-a|} > 0$, the angle between $\frac{b-a}{|b-a|}$ and θ is at least $\beta^{\frac{1}{8}}$ and $H^1([a,b]\setminus\mathcal{G}) \leq \beta^{\frac{1}{4}}$. Let $\mathcal{G}_1 = \left\{x \in \mathcal{G} : \nabla u(z) \cdot R^{-1}\left(\theta\right) > 0\right\}$ and $\mathcal{G}_2 = \mathcal{G}\backslash\mathcal{G}_1$. As can be seen from figure 1 we can connect a to b with a path $\Gamma \subset \mathcal{A}$ so

$$\begin{aligned} |w_\theta(b) - w_\theta(a)| &= \left|\int_\Gamma \nabla w_\theta(z) t_z dH^1 z\right| \geq \left|R\theta \cdot \left(\int_\Gamma t_z dH^1 z\right)\right| - c\beta^{\frac{1}{4}} \\ &= \left|R\theta \cdot \frac{b-a}{|b-a|}\right| |b-a| - c\beta^{\frac{1}{4}}. \end{aligned} \tag{14}$$

On the other hand

$$\begin{aligned} |w_\theta(b)-w_\theta(a)| &= \left|\int_{[a,b]} \nabla w_\theta(z)\frac{b-a}{|b-a|}dH^1z\right| \leq \left|\int_{[a,b]\cap\mathcal{G}_1} \nabla w_\theta(z)\frac{b-a}{|b-a|}dH^1z\right| + c\beta^{\frac{1}{4}} \\ &\leq \left|\int_{[a,b]\cap\mathcal{G}_1} R\theta\cdot\frac{b-a}{|b-a|}dH^1z\right| + c\beta^{\frac{1}{4}} \\ &= \left|R\theta\cdot\frac{b-a}{|b-a|}\right| H^1([a,b]\cap\mathcal{G}_1) + c\beta^{\frac{1}{4}} \end{aligned} \tag{15}$$

and since $\left|R\theta\cdot\frac{b-a}{|b-a|}\right| \geq \beta^{\frac{1}{8}}$ so putting (14) and (15) together

$$|a-b| \leq H^1\left([a,b]\cap\mathcal{G}_1\right) + \frac{c\beta^{\frac{1}{4}}}{\left|R\theta\cdot\frac{b-a}{|b-a|}\right|} \leq H^1\left([a,b]\cap\mathcal{G}_1\right) + c\beta^{\frac{1}{8}}.$$

So by arguing in the same way for lines parallel to $[a,b]$ by Fubini's theorem we can show $\left|H\left(\frac{a+b}{2}, R\left(\frac{b-a}{|b-a|}\right)\right)\setminus\mathcal{G}_1\right| \leq c\beta^{\frac{1}{8}}$. Thus all but $\beta^{\frac{1}{8}}$ points $z\in B_1(0)\cap H(0,R(\theta))$ are such that $\nabla u(z)\cdot R^{-1}(\theta) > 0$. As θ is arbitrary we can rephrase this the following way. Given $\phi\in S^1$ for all but $\beta^{\frac{1}{8}}$ points $z\in B_1(0)\cap H(0,\phi)$ are such that $\nabla u(z)\cdot(-\phi) > 0$.

Now take $\psi = \begin{pmatrix}\cos\beta^{\frac{1}{16}}\\ \sin\beta^{\frac{1}{16}}\end{pmatrix}$. For all but $\beta^{\frac{1}{8}}$ points in $H(0,e_1)\cap H(0,-\psi)\cap H(0,-e_2)$ we have that $\nabla u(z)\cdot(-e_1) > 0$ and $\nabla u(z)\cdot\psi > 0$, it is not hard to show this implies $|\nabla u(z)\cdot e_1| \leq c\beta^{\frac{1}{16}}$ and since $\nabla u(z)\cdot e_2 > 0$ and $|\nabla u(z)| \sim 1$ we have $\nabla u(z)\in B_{c\beta^{\frac{1}{16}}}(e_2)$ with an exceptional set of measure less than $c\beta^{\frac{1}{8}}$. So integrating a carefully chosen line inside $H(0,e_1)\cap H(0,-\psi)\cap H(0,-e_2)$ and using the fact that $u=0$ on $\partial B_1(0)$ we can show $|u(0)-1| \leq c\beta^{\frac{1}{16}}$.

Now since $|\nabla u|$ is mostly very close to 1 and we have zero boundary condition, so avoiding technicalities assuming the coarea formula we have $\int_{\theta\in S^1}\int_{\mathbb{R}_+\theta\cap B_1(0)}\left||\nabla u(z)|^2-1\right|dH^1zdH^1\theta \leq c\sqrt{\beta}$. Note also that for any $\theta\in S^1$, $u(\theta)=0$ so by the fundamental theorem of Calculus

$$\begin{aligned} \left|\int_{\mathbb{R}_+\theta\cap B_1(0)}\nabla u(z)\cdot(-\theta)dH^1z - 1\right| &\leq |(u(0)-u(\theta))-1| \\ &\leq c\beta^{\frac{1}{16}} \end{aligned}$$

so

$$\begin{aligned} &\int_{\theta\in S^1}\int_{\mathbb{R}_+\theta\cap B_1(0)} |\nabla u(z)+\theta|^2\, dH^1z\theta \\ &\qquad = \int_{\theta\in S^1}\int_{\mathbb{R}_+\theta\cap B_1(0)} |\nabla u(z)|^2 + 2\nabla u(z)\cdot\theta + |\theta|^2\, dH^1zdH^1\theta \\ &\qquad \leq c\beta^{\frac{1}{16}}. \end{aligned} \tag{16}$$

This concludes the sketch of the proof of Theorem 2.

2.2. **Sketch of the proof of Corollary 1.** In order to deduce Corollary 1 we need to apply Theorem 1 to the minimizer of I_ϵ over $\Lambda(\Omega)$. We can only do this if the minimiser has small energy (and from Theorem 1 we know it can only have small energy if Ω is close to a ball). For this reason it is necessary to construct a function in $\Lambda(\Omega)$ with this property. It turns out this is a surprisingly delicate task, it is achieved in Section 4 of the paper.

The obvious way to attempt the construction is to make some adaption of the function $\zeta(z) = \operatorname{dist}(z,\partial\Omega)$, this function clearly satisfies the correct boundary condition. The first problem is

that $\nabla\zeta$ will have its gradient in BV and it is easy to construct examples of convex domains that are close to balls for which the singular part of $\nabla\zeta$ is widely spread over the domain. So it is necessary to convolve ζ, however convolution will destroy the boundary condition. To circumvent this obstacle, in a neighborhood of the boundary we convolve the ζ with a convolution kernel who support decreases in proportionally to the distance to the boundary. We make the assumption that $\partial\Omega$ is C^2 with curvature bounded above by $\epsilon^{-\frac{1}{2}}$ and this allows us estimate the various error terms involved in differentiating a function the convolved with a kernel of varying support.

3. Proof of Theorem

It should be re-emphasized that the main calculations that makes this lemma work (specifically equation (23)) are very minor adoptions of the calculations in [De-Ko-Mu-Ot 00].

Lemma 1. *Let Ω be a convex body centered on 0 with $\operatorname{diam}(\Omega) \leq 2$. Suppose $u : W^{2,1}(\Omega) \to \mathbb{R}$ satisfies (6) and (7). For each $\theta \in S^1$ define $\Lambda_\theta : \mathbb{R}^2 \to S^1$ be defined by*

$$\Lambda_\theta(z) = \begin{cases} \theta & \text{if } z \cdot \theta > 0, \\ 0 & \text{if } z \cdot \theta \leq 0. \end{cases} \tag{17}$$

Let $R \in SO(2)$ be the anti-clockwise rotation defined by $R(z_1, z_2) = (-z_2, z_1)$ and let $m = R(\nabla u)$, we will show there exists a set $\Gamma \subset S^1$ with $H^1(S^1 \backslash \Gamma) \leq c\beta^{\frac{1}{8}}$ and $-\Gamma = \Gamma$ such that for any $\theta \in \Gamma$ we can find function $w_\theta : \Omega \to \mathbb{R}$ with the property

$$\int_\Omega |\nabla w_\theta - R(\Lambda_\theta(m))| \leq c\beta^{\frac{1}{8}}. \tag{18}$$

Proof of Lemma 1. Let $M = 2\left[\frac{\beta^{-\frac{1}{4}}}{8}\right]$, we divide S^1 into M disjoint connected subsets of length $\frac{2\pi}{M}$, denote them $A_1, A_2, \ldots A_M$. We assume they have been ordered sequentially, i.e. $\overline{A_i} \cap \overline{A_{i+1}} \neq \emptyset$ for $i = 1, 2, \ldots M-1$. Also assume they have been ordered so that $-A_i = A_{i+\frac{M}{2}}$ for $i = 1, 2, \ldots \frac{M}{2}$. Let

$$\mathcal{B} = \left\{ k \in \left\{1, 2, \ldots \frac{M}{2}\right\} : \left| \left\{ x \in \Omega : \frac{\nabla u(x)}{|\nabla u(x)|} \in \overline{A_k} \cup \overline{A_{k+\frac{M}{2}}} \right\} \right| \geq \beta^{\frac{1}{8}} \right\}.$$

Since $\operatorname{Card}(\mathcal{B})\,\beta^{\frac{1}{8}} \leq |\Omega| \leq 4\pi$ we have that $\operatorname{Card}(\mathcal{B}) \leq 4\pi\beta^{-\frac{1}{8}}$.

Let $\mathcal{D} := \left\{ k \in \left\{2, 3, \ldots \frac{M}{2} - 1\right\} : \{k-1, k, k+1\} \cap \mathcal{B} \neq \emptyset \right\}$. A simple covering argument shows that $\operatorname{Card}(\mathcal{D}) \leq c\beta^{-\frac{1}{8}}$. Let $\Gamma = \bigcup_{k \in \left\{2,3,\ldots\frac{M}{2}-1\right\} \backslash D} \overline{A_k} \cup \overline{A_{k+\frac{M}{2}}}$. Note that for any $\theta \in \Gamma$ we have

$$\left| \left\{ x \in \Omega : \frac{\nabla u(x)}{|\nabla u(x)|} \in B_{2\beta^{\frac{1}{8}}}(\theta) \cup B_{2\beta^{\frac{1}{8}}}(-\theta) \right\} \right| \leq 3\beta^{\frac{1}{8}}. \tag{19}$$

So pick $\theta \in \Gamma$ without loss of generality we can assume $\theta = e_1$. Let $s : \mathbb{R} \to \mathbb{R}_+$ be a smooth monotone function where $s(x) = 0$ if $x \leq 0$ and $s(x) = x$ if $x > \beta^{\frac{1}{4}}$ and $\|\nabla^2 s\|_{L^\infty} \leq \beta^{-\frac{1}{4}}$ and $\|\nabla^3 s\|_{L^\infty} \leq \beta^{-\frac{1}{2}}$, it is clear such a function exists.

Let $\varphi(z) = s(z \cdot e_1) = s(z_1)$. Define $\Phi : \mathbb{R}^2 \to \mathbb{R}^2$ by

$$\begin{aligned} \Phi(z) &:= \varphi(z) \begin{pmatrix} z_1 \\ z_2 \end{pmatrix} + \left(\nabla\varphi(z) \cdot \begin{pmatrix} -z_2 \\ z_1 \end{pmatrix} \right) \begin{pmatrix} -z_2 \\ z_1 \end{pmatrix} \\ &= \begin{pmatrix} \varphi(z) z_1 + z_2^2 \varphi_{,1}(z) \\ \varphi(z) z_2 - z_2 z_1 \varphi_{,1}(z) \end{pmatrix}. \end{aligned} \tag{20}$$

Define

$$\Psi(z) = \begin{pmatrix} \Psi_1(z) \\ \Psi_2(z) \end{pmatrix} := \begin{pmatrix} -\varphi_{,1}(z) \\ \frac{z_2}{2}\varphi_{,11}(z) \end{pmatrix}. \tag{21}$$

Recall $m(z) := R(\nabla u(z))$ so m is divergence free. Note (using the fact $\varphi_{,2} \equiv 0$ and $\varphi_{,12} \equiv 0$ and $\mathrm{div} m \equiv 0$ for the third inequality, and using $\mathrm{div} m = 0$ for the last inequality)

$$\begin{aligned}
\mathrm{div}\left[\Phi(m)\right] &= \mathrm{div}\begin{pmatrix} \varphi(m)\, m_1 + m_2^2 \varphi_{,1}(m) \\ \varphi(m)\, m_2 - m_2 m_1 \varphi_{,1}(m) \end{pmatrix} \\
&= (\varphi_{,1}(m)m_{1,1} + \varphi_{,2}(m)m_{2,1})m_1 + \varphi(m)m_{1,1} + 2m_2 m_{2,1}\varphi_{,1}(m) \\
&\quad + m_2^2(\varphi_{,11}(m)m_{1,1} + \varphi_{,12}(m)m_{2,1}) + (\varphi_{,1}(m)m_{1,2} + \varphi_{,2}(m)m_{2,2})m_2 \\
&\quad + \varphi(m)m_{2,2} - ((m_{1,2}m_2 + m_1 m_{2,2})\varphi_{,1}(m) \\
&\quad + m_1 m_2(\varphi_{,11}(m)m_{1,2} + \varphi_{,12}(m)m_{2,2})) \\
&= m_1\varphi_{,1}(m)m_{1,1} + 2m_2 m_{2,1}\varphi_{,1}(m) + m_2^2 m_{1,1}\varphi_{,11}(m) + m_2 m_{1,2}\varphi_{,1}(m) \\
&\quad - ((m_{1,2}m_2 + m_1 m_{2,2})\varphi_{,1}(m) + m_1 m_2 m_{1,2}\varphi_{,11}(m) \\
&= 2\varphi_{,1}(m)(m_1 m_{1,1} + m_2 m_{2,1}) - \varphi_{,11}(m)m_2(m_1 m_{1,2} + m_2 m_{2,2}). \qquad (22)
\end{aligned}$$

Note also that

$$\begin{aligned}
\Psi(m)\cdot\nabla(1-|m|^2) &= -\Psi(m)\cdot\begin{pmatrix} 2(m_1 m_{1,1} + m_2 m_{2,1}) \\ 2(m_1 m_{1,2} + m_2 m_{2,2}) \end{pmatrix} \\
&= 2\varphi_{,1}(m)(m_1 m_{1,1} + m_2 m_{2,1}) - m_2\varphi_{,11}(m)(m_1 m_{1,2} + m_2 m_{2,2})
\end{aligned}$$

so by (22) we have

$$\mathrm{div}\left[\Phi(m)\right] = \Psi(m)\cdot\nabla(1-|m|^2). \qquad (23)$$

Let $\tilde{\Phi} := R(\Phi)$ and $\tilde{\Psi} := R(\Psi)$ note $\mathrm{curl}\left[\tilde{\Phi}(m)\right] \overset{(23)}{=} \mathrm{div}\left[\Phi(m)\right] = \Psi(m)\cdot\nabla(1-|m|^2)$. So

$$\begin{aligned}
\mathrm{curl}\left[\tilde{\Psi}(m)(1-|m|^2)\right] &= \mathrm{div}[\Psi(m)](1-|m|^2) + \Psi(m)\cdot\nabla(1-|m|^2) \\
&= \mathrm{div}\left[\Psi(m)\right](1-|m|^2) + \mathrm{curl}\left[\tilde{\Phi}(m)\right]. \qquad (24)
\end{aligned}$$

Thus using the fact that $|\nabla\Psi(z)| \le c|z|\,\|\nabla^3\varphi\|_{L^\infty(\mathbb{R}^2)} \le c\beta^{-\frac{1}{2}}|z|$ we have

$$\begin{aligned}
&\mathrm{curl}\left[\tilde{\Phi}(m) - \tilde{\Psi}(m)(1-|m|^2)\right] \\
&\quad \overset{(24)}{=} -\mathrm{div}[\Psi(m)](1-|m|^2) \\
&\quad = -(\Psi_{1,1}(m)m_{1,1} + \Psi_{1,2}(m)m_{2,1} + \Psi_{2,1}(m)m_{1,2} + \Psi_{2,2}(m)m_{2,2})(1-|m|^2) \\
&\quad \le c\beta^{-\frac{1}{2}}|m|\left|1-|m|^2\right||\nabla m|. \qquad (25)
\end{aligned}$$

Hence

$$\int_\Omega \left|\mathrm{curl}\left[\tilde{\Phi}(m) - \tilde{\Psi}(m)(1-|m|^2)\right]\right| \le c\beta^{-\frac{1}{2}}\int_\Omega |m|\left|1-|m|^2\right||\nabla m|$$

So using (25), note that if x is such that $|m(x)| \ge 2$ then for $J(x) := |m(x)|^3$ we have $|\nabla J(x)| \le c\left|1-|m|^2\right||\nabla m|$ and so

$$\int_{\{x:2\le|m(x)|\le 4\}} |\nabla J(x)|\,dx \le c\int_\Omega \left|1-|m|^2\right||\nabla m| \le c\beta$$

so applying the Co-area formula we know $\int_8^{64} H^1(J^{-1}(s))ds \le c\beta$ thus we must be able to find $t \in [8,64]$ such that $H^1(J^{-1}(t)) \le c\beta$.

Let

$$\mathcal{G} := \{x \in \Omega : J(x) < t\}. \qquad (26)$$

We claim we can construct a C^1 Lipschitz vector field $\Theta = \binom{\Theta_1}{\Theta_2} : \mathbb{R}^2 \to \mathbb{R}^2$ with the property $\Theta(x) = \tilde{\Phi}(x) - \tilde{\Psi}(x)(1-|x|^2)$ for $x \in B_{64}(0)$. This can been seen by applying Whitney's

extension theorem (Theorem 1, Section 6.5 [Ev-Ga 92]) in the following way. Let $d_1(x) = \nabla\left[(\tilde{\Phi}(x) - \tilde{\Psi}(x)(1-|x|^2)) \cdot e_1\right]$ for $x \in \overline{B_{64}(0)}$ and let $d_2(x) = d_1(\frac{64x}{|x|})$, define $d : \mathbb{R}^2 \to \mathbb{R}^2$ to be equal to d_1 in $B_{64}(0)$ and equal to d_2 outside it. Notice that d and $(\tilde{\Phi}(x) - \tilde{\Psi}(x)(1-|x|^2)) \cdot e_1$ satisfy the hypotheses of Whitney's extension theorem so there exists a Lipschitz C^1 function Θ_1 which agrees with $(\tilde{\Phi}(x) - \tilde{\Psi}(x)(1-|x|^2)) \cdot e_1$ on $B_{64}(0)$. There existence of Θ_2 follows in the same way.

Define $w : \Omega \to \mathbb{R}$ by

$$w(x) = \begin{cases} \tilde{\Phi}(m) - \tilde{\Psi}(m)(1-|m|^2) & \text{for } x \in \mathcal{G} \\ 0 & \text{for } x \in \Omega \backslash \mathcal{G} \end{cases} \tag{27}$$

So if $x \in \mathcal{G}$,

$$\begin{aligned} \text{curl}(w) &= \text{curl}\left(\tilde{\Phi}(m) - \tilde{\Psi}(m)(1-|m|^2)\right) \\ &\overset{(25),(26)}{\leq} c\beta^{-\frac{1}{2}} |1-|m|| \, |\nabla m| \, . \end{aligned} \tag{28}$$

So if $x \in \text{int}\,(\Omega \backslash \mathcal{G})$, $\text{curl}\left(\tilde{\Phi}(m) - \tilde{\Psi}(m)(1-|m|^2)\right) = 0$.

Since $m \in W^{1,1}(\Omega)$ and Θ is C^1 Lipschitz so the vector field $\Theta(m)$ is BV by Theorem 3.94 [Am-Fu-Pa 00]. So by Theorem 3.83 [Am-Fu-Pa 00] we have that w is also BV and the singular part of ∇w, which we denote by $[\nabla w]_s$, is supported on $J^{-1}(t) \cap \Omega$ and as $\left|\tilde{\Phi}(m(x))\right| \leq c\,|m(x)|^2$ and $\left|\tilde{\Psi}(m(x))\right| \leq c\beta^{-\frac{1}{4}} |m(x)|$ we have that

$$\text{ess sup}_{J^{-1}(t)\cap\Omega} \left|\tilde{\Phi}(m(x)) - \tilde{\Psi}(m(x))(1-|m(x)|^2)\right| \leq c\beta^{-\frac{1}{4}}$$

and thus $\| [\nabla w]_s \|(S) \leq c\beta^{-\frac{1}{4}} H^1(J^{-1}(t) \cap \Omega) \leq c\beta^{\frac{3}{4}}$. Now we know that for any set $S \subset \Omega$,

$$\|\text{curl} w\|(S) \leq c\|\nabla w\|(S)$$

and so in particular

$$\|\text{curl} w\|(J^{-1}(t)) \leq c\|\nabla w\|(J^{-1}(t)) \leq c\beta^{\frac{3}{4}}. \tag{29}$$

Thus

$$\begin{aligned} \|\text{curl} w\|(\Omega) &\leq \|\text{curl} w\|(J^{-1}(t)) + \|\text{curl} w\|(\mathcal{G}) \\ &\quad + \|\text{curl} w\|(\text{int}(\Omega \backslash \mathcal{G})) \\ &\overset{(28),(29)}{\leq} c\beta^{\frac{3}{4}} + c\beta^{-\frac{1}{2}} \int_{\mathcal{G}} |1-|m|| \, |\nabla m| \\ &\overset{(6)}{\leq} c\sqrt{\beta}. \end{aligned} \tag{30}$$

Now we try and understand the nature of vector field $\tilde{\Phi}(m(x)) - \tilde{\Psi}(m(x))(1-|m(x)|^2)$. Note that if $z \in N_{\sqrt{\beta}}\left(S^1\right) \cap \{z_1 > 0\} \setminus \left(B_{2\beta^{\frac{1}{4}}}(e_2) \cup B_{2\beta^{\frac{1}{4}}}(-e_2)\right)$ then $\varphi(z) = z_1$, $\varphi_{,1}(z) = 1$ and so $\Phi(z) \overset{(20)}{=} \begin{pmatrix} z_1^2 + z_2^2 \\ 0 \end{pmatrix}$ on the other hand if $z \in N_{\sqrt{\beta}}(S^1) \cap \{z_1 \leq 0\} \setminus \left(B_{2\beta^{\frac{1}{4}}}(e_2) \cup B_{2\beta^{\frac{1}{4}}}(-e_2)\right)$ then $\varphi(z) = \varphi_{,1}(z) = 0$ and so $\Phi(z) = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$.

Now if $z \in N_{\sqrt{\beta}}(S^1) \cap \{z_1 > 0\} \setminus \left(B_{2\beta^{\frac{1}{4}}}(e_2) \cup B_{2\beta^{\frac{1}{4}}}(-e_2)\right)$ we have

$$\begin{aligned}\left|(\tilde{\Phi}(z) + \tilde{\Psi}(z)(1-|z|^2)) - R(\Lambda_{e_1}(z))\right| &\leq \left|\tilde{\Phi}(z) - R(\Lambda_{e_1}(z))\right| + c\sqrt{\beta}\sup_{z\in N_{\sqrt{\beta}}(S^1)}\left|\tilde{\Psi}(z)\right| \\ &= \left|R\begin{pmatrix} z_1^2+z_2^2 \\ 0\end{pmatrix} - R\begin{pmatrix}1\\0\end{pmatrix}\right| + c\beta^{\frac{1}{4}} \\ &\leq c\beta^{\frac{1}{4}}. \end{aligned} \tag{31}$$

And if we have $z \in N_{\sqrt{\beta}}\left(S^1\right) \cap \{z_1 \leq 0\} \setminus \left(B_{2\beta^{\frac{1}{4}}}(e_2) \cup B_{2\beta^{\frac{1}{4}}}(-e_2)\right)$ arguing in the same way we can conclude

$$\left|(\tilde{\Phi}(z) + \tilde{\Psi}(z)(1-|z|^2)) - R(\Lambda_{e_1}(z))\right| \leq c\beta^{\frac{1}{4}}. \tag{32}$$

Let $\Pi := \left\{z \in \Omega : |m(z)| \in (1-\sqrt{\beta}, 1+\sqrt{\beta})\right\}$ and let

$$\mathcal{E} := \left\{x \in \Omega : \frac{\nabla u(x)}{|\nabla u(x)|} \in B_{2\beta^{\frac{1}{4}}}(e_2) \cup B_{2\beta^{\frac{1}{4}}}(-e_2)\right\}, \tag{33}$$

note from (19) we know $|\mathcal{E}| \leq 3\beta^{\frac{1}{8}}$. Note also $\sqrt{\beta}\,|\Omega\backslash\Pi| \leq c\int_{\Omega\backslash\Pi}\left|1-|\nabla u|^2\right| \overset{(7)}{\leq} \beta$ thus

$$|\Omega\backslash\Pi| \leq c\sqrt{\beta}. \tag{34}$$

Now from (31) and (32)

$$\left|\int_{\Pi\backslash\mathcal{E}}(\tilde{\Phi}(m) - \tilde{\Psi}(m)(1-|m|^2)) - R(\Lambda_{e_1}(m))\right| \leq c\beta^{\frac{1}{4}} \tag{35}$$

on the other hand recalling the fact that $\left|\tilde{\Psi}(z)\right| \leq \beta^{-\frac{1}{4}}|z|$, $\left|\tilde{\Phi}(z)\right| \leq c|z|^2$ and using the definition of $\mathcal{G}$ (see (26)) we have

$$\begin{aligned}&\left|\int_{\mathcal{G}\backslash\Pi}\left((\tilde{\Phi}(m) - \tilde{\Psi}(m)(1-|m|^2)) - R(\Lambda_{e_1}(m))\right)\right| \\ &\qquad \leq c|\mathcal{G}\backslash\Pi| \\ &\qquad \overset{(34)}{\leq} c\sqrt{\beta}. \end{aligned} \tag{36}$$

Thus applying (35) to (36) gives

$$\left|\int_{\mathcal{G}\backslash\mathcal{E}}\left((\tilde{\Phi}(m) - \tilde{\Psi}(m)(1-|m|^2)) - R(\Lambda_{e_1}(m))\right)\right| \leq c\beta^{\frac{1}{4}}. \tag{37}$$

Recall we have $|\mathcal{E}| \leq 3\beta^{\frac{1}{8}}$ so

$$\begin{aligned}\left|\int_{\mathcal{E}\cap\mathcal{G}}\left((\tilde{\Phi}(m) - \tilde{\Psi}(m)(1-|m|^2)) - R(\Lambda_{e_1}(m))\right)\right| &\leq c|\mathcal{E}| \\ &\leq c\beta^{\frac{1}{8}}. \end{aligned}$$

Putting this inequality together with (37) gives

$$\left|\int_{\mathcal{G}}\left((\tilde{\Phi}(m) - \tilde{\Psi}(m)(1-|m|^2)) - R(\Lambda_{e_1}(m))\right)\right| \leq c\beta^{\frac{1}{8}}. \tag{38}$$

So by definition of w (see (27)) we have that

$$\begin{aligned}\left|\int_\Omega w - R(\Lambda_{e_1}(m))\right| &\overset{(38)}{\leq} c\beta^{\frac{1}{8}} + \left|\int_{\Omega\backslash\mathcal{G}} R(\Lambda_{e_1}(m))\right| \\ &\leq c\beta^{\frac{1}{8}} + |\Omega\backslash\mathcal{G}| \\ &\overset{(34)}{\leq} c\beta^{\frac{1}{8}}. \end{aligned} \tag{39}$$

Now from (30) applying Theorem 4.3 from ([Am-De-Ma 99]) there exists $w_{e_1} \in W^{1,1}(\Omega)$ such that

$$\int_\Omega |\nabla w_{e_1} - w| \leq c\beta^{\frac{1}{8}} \tag{40}$$

thus putting this together with (39) and gives (18). □

Lemma 2. *Let Ω be a convex body centered on 0 and let $u : W^{2,2}(\Omega) \to \mathbb{R}$ be a function satisfying (6) and (7) and $u = 0$ on $\partial\Omega$ and $\nabla u(z) \cdot \eta_z = 1$ on $\partial\Omega$ in the sense of trace, where η_z is the inward pointing unit normal to $\partial\Omega$ at z.*

For any $r > 0$ define $\Omega_r := N_r(\Omega)$, we will show we can construct a function $\tilde{u} : W^{2,1}(\Omega_r) \to \mathbb{R}$ satisfying

$$\int_{\Omega_r} \left|1 - |\nabla\tilde{u}|^2\right| \left|\nabla^2\tilde{u}\right| \leq \beta, \quad \int_{\Omega_r} \left|1 - |\nabla\tilde{u}|^2\right| \leq \beta, \tag{41}$$

and

$$\tilde{u}(z) = \begin{cases} u(z) + r & \text{for } z \in \overline{\Omega} \\ r - d(z,\Omega) & \text{if } z \in \Omega_r\backslash\Omega \end{cases} \tag{42}$$

Proof of Lemma 2.

Step 1. We will show $\nabla u(x) = \eta_x$ for H^1 a.e. $x \in \partial\Omega$

Proof of Step 1. Recall $\nabla u \in W^{1,1}(\Omega)$ and ∇u is defined on $\partial\Omega$ in the sense of trace, as the trace operator is bounded we know $\int_{\partial\Omega} |\nabla u|\, dH^1 < \infty$.

We define

$$v(z) = \begin{cases} u(z) & \text{for } z \in \overline{\Omega} \\ 0 & \text{if } z \in \Omega_r\backslash\Omega \end{cases} \tag{43}$$

So note the vector field $\nabla v(z)$ is equal to $\nabla u(z)$ inside Ω and is zero outside, so by Theorem 3.8 [Am-Fu-Pa 00] $\nabla v \in BV(\Omega_r)$ and hence by Theorem 3.76 [Am-Fu-Pa 00] and Theorem 2, Section 5.3 [Ev-Ga 92] for H^1 a.e. $x \in \partial\Omega$ the following limits exist

$$\lim_{\rho\to 0} \fint_{B^+(x,\eta_x)} |\nabla u(z) - \nabla u(x)|\, dz = 0 \tag{44}$$

and

$$\lim_{\rho\to 0} \fint_{B^-(x,\eta_x)} |\nabla u(z)|\, dz = 0. \tag{45}$$

Let $w_x^\rho(z) = \frac{u(\rho(z-x))}{\rho}$, by (44) and (45) for any sequence $\rho_n \to 0$ we have $w_x^{\rho_n}(z) \overset{L^1}{\to} w_x$ as $n \to \infty$ where

$$w_x(z) = \begin{cases} \nabla u(x) \cdot z & \text{for } z \in H(0,\eta_x) \\ 0 & \text{for } z \in H(0,-\eta_x) \end{cases} \tag{46}$$

however w_x would not be curl free unless $\nabla u(x) = \lambda\eta_x$ for some $\lambda \in \mathbb{R}$. As we know $\nabla u(x) \cdot \eta_x = 1$ this implies $\nabla u(x) = \eta_x$ for H^1 a.e. $x \in \partial\Omega$. This completes the proof of Step 1.

Step 2. For any $z \in \Omega_r\backslash\Omega$, $\tilde{u}(z) = d(z, \partial\Omega_r)$.

Proof of Step 2. Note that $\|\nabla\tilde{u}\|_{L^\infty(\Omega_r\setminus\Omega)} \leq 1$. Let $x \in \partial\Omega_r$, let $q(x)$ be the metric projection onto a convex set Ω, i.e. the unique point for which $|x-q(x)| = d(x,\Omega)$. Since $x \in \partial\Omega_r = \partial(N_r(\Omega)) = \{x \in \Omega^c : d(x,\Omega) = r\}$ so $|x-q(x)| \geq r$, on the other hand we also know $d(x,\Omega) = r$ so there must exist $y \in \Omega$ such that $|x-y| < r+\delta$ for every $\delta > 0$, this implies $|x-q(x)| < r+\delta$ for every $\delta > 0$. Thus $|x-q(x)| = r$.

Since $\tilde{u}(x) = 0$ and $\tilde{u}(q(x)) = r$ and as $\tilde{u}$ is 1-Lipschitz on $\Omega_r\setminus\Omega$ this implies $\tilde{u}((1-\alpha)x + \alpha q(x)) = \alpha r$ for any $\alpha \in [0,1]$.

Now let $Q(z) := d(z, \partial\Omega_r)$. For every $x \in \partial\Omega_r$, $Q(q(x)) \leq |q(x)-x| = r$. As $\partial\Omega_r = \partial(N_r(\Omega))$ so we know $Q(q(x)) \geq r$ and thus have $Q(q(x)) = r$. We also know Q is 1-Lipschitz and $Q(x) = 0$, thus in the same way as before $Q((1-\alpha)x + \alpha q(x)) = \alpha r$ for any $\alpha \in [0,1]$. Therefor $Q(z) = \tilde{u}(z)$ for any $z \in [x, q(x)]$, $x \in \partial\Omega_r$ and this completes the proof of Step 1.

Step 3. We will show that $\tilde{u} \in W^{2,1}(\Omega_r)$ and that $\tilde{u}$ satisfies (41).

Proof of Step 3. First we claim that

$$\int_{\Omega_r\setminus\Omega} \left|\nabla^2\tilde{u}\right| dz \leq c \text{ and hence } \nabla\tilde{u} \in W^{1,1}(\Omega_r\setminus\Omega). \tag{47}$$

Note $\tilde{u}_{\lfloor\Omega_r\setminus\Omega}$ is a 1-Lipschitz function with $\tilde{u} = 0$ on $\partial\Omega_r$ and $\tilde{u} = r$ on $\partial\Omega$. So by the Co-area formula we have $\int_{\Omega_r\setminus\Omega} \left|\nabla^2\tilde{u}\right| dx = \int_0^r \int_{\tilde{u}^{-1}(h)} \left|\nabla^2\tilde{u}\right| dH^1 dh$. Recall $\tilde{u}(x) = r - d(z,\Omega)$ for $z \in \Omega_r\setminus\Omega$, so as Ω is convex for every $z \in \Omega_r\setminus\Omega$ there is a unique point $b(z) \in \partial\Omega$ such that $d(z,\Omega) = |b(z)-z|$ and $\nabla\tilde{u}(z) = \frac{b(z)-z}{|b(z)-z|}$, since b is a continous function this shows that $\tilde{u}$ is C^1 in $\Omega_r\setminus\overline{\Omega}$ and $|\nabla\tilde{u}| = 1$ on $\Omega_r\setminus\overline{\Omega}$. Note this also implies $\tilde{u}^{-1}(h)$ is the boundary of a smooth convex set and for each $z \in \tilde{u}^{-1}(h)$, $\nabla\tilde{u}(z)$ is normal to the tangent of $\tilde{u}^{-1}(h)$ at z, so $\int_{\tilde{u}^{-1}(h)} \left|\nabla^2\tilde{u}\right| dH^1 \leq c$ for all $h \in [0,r]$ and hence (47) is shown.

Since Ω is an extension domain by Theorem 1, Section 4.4 [Ev-Ga 92] there exists a function $p : W^{1,2}(\mathbb{R}^2) \to \mathbb{R}^2$ such that $p(z) = \nabla\tilde{u}(z)$ on Ω and Spt$p$ is compact. Similarly as $\Omega_r\setminus\Omega$ is an extension domain there exists a function $q : W^{1,1}(\mathbb{R}^2) \to \mathbb{R}^2$ such that $q(z) = \nabla\tilde{u}(z)$ on $\Omega_r\setminus\Omega$ and Spt$q$ is compact. We define $w : \Omega_r \to \mathbb{R}^2$ by $w := p\mathbb{1}_\Omega + q\mathbb{1}_{\Omega_r\setminus\Omega}$, by Theorem 3.83 [Am-Fu-Pa 00] $w \in BV(\Omega_r : \mathbb{R}^2)$ and since p and q agree on $\partial\Omega$ we have that ∇w as a measure is absolutely continuous with respect to Lebesgue measure (and hence $w \in W^{1,1}(\Omega_r : \mathbb{R}^2)$) and $\nabla w = \nabla p\mathbb{1}_\Omega + \nabla q\mathbb{1}_{\Omega_r\setminus\Omega}$. Now as $w = \nabla\tilde{u}$ a.e. in Ω_r we have that $\nabla\tilde{u} \in W^{1,1}(\Omega_r)$.

Since $\nabla^2\tilde{u} \in L^1$ we know

$$\begin{aligned}
\int_{\Omega_r} \left|1-|\nabla\tilde{u}|^2\right| \left|\nabla^2\tilde{u}\right| dz &= \int_\Omega \left|1-|\nabla\tilde{u}|^2\right| \left|\nabla^2\tilde{u}\right| dz + \int_{\Omega_r\setminus\Omega} \left|1-|\nabla\tilde{u}|^2\right| \left|\nabla^2\tilde{u}\right| dz \\
&= \int_\Omega \left|1-|\nabla\tilde{u}|^2\right| \left|\nabla^2\tilde{u}\right| dz \\
&\leq \beta.
\end{aligned}$$

Similarly $\int_{\Omega_r} \left|1-|\nabla\tilde{u}|^2\right| dz = \int_\Omega \left|1-|\nabla\tilde{u}|^2\right| dz \leq \beta$. □

Lemma 3. *Let Ω be a convex body with* $\operatorname{diam}(\Omega) = 2$. *Let $u : W^{2,2}(\Omega) \to \mathbb{R}$ be a function satisfying (6) and (7) and $u = 0$ on $\partial\Omega$ and $\nabla u(z)\cdot\eta_z = 1$ on $\partial\Omega$ in the sense of trace where η_z is the inward pointing unit normal to $\partial\Omega$ at z. For any $x, v \in \mathbb{R}^2$ let $H(x,v) := \{z \in \mathbb{R}^2 : (z-x)\cdot v > 0\}$.*

Let $\Gamma \subset S^1$ be the set constructed in Lemma 1. Let $\mathcal{U} := \Omega_{1/10}$ be the convex body and $\tilde{u} : W^{2,1}(\mathcal{U}) \to \mathbb{R}$ be the function constructed in Lemma 2. Let R be the anti-clockwise rotation defined by $R(z_1,z_2) = (-z_2, z_1)$. Let $R_0 \in \{R^{-1}, R\}$.

For a.e. $\theta \in \Gamma$ there exists unique points $a_\theta, b_\theta \in \partial\mathcal{U}$ with $\eta_{a_\theta} = \theta$ and $\eta_{b_\theta} = -\theta$ the property that if we define $\mathcal{G}_\theta^{R_0} := \left\{ z \in \mathcal{U} : \nabla \tilde{u}(z) \cdot R_0^{-1}\theta > 0 \right\}$ we have

$$\left| \mathcal{U} \cap H\left(\frac{a_\theta + b_\theta}{2}, R_0\left(\frac{b_\theta - a_\theta}{|b_\theta - a_\theta|} \right) \right) \backslash \mathcal{G}_\theta^{R_0} \right| \leq c\beta^{\frac{1}{24}}. \tag{48}$$

Proof of Lemma 3. Without loss of generality assume Ω is centered on 0, i.e. $\int_\Omega z = 0$. Since $\partial\mathcal{U}$ is smooth and $\mathcal{U}$ is convex there exists a set $\Xi \subset S^1$ with $H^1(S^1 \backslash \Xi) = 0$ with the following property,

$$\exists \text{ unique } a_\varphi \in \partial\mathcal{U} \text{ with } \eta_{a_\varphi} = \varphi \text{ and a unique } b_\varphi \in \partial\mathcal{U} \text{ with } \eta_{b_\varphi} = -\varphi \text{ for all } \varphi \in \Xi. \tag{49}$$

Pick $\theta \in \Xi \cap \Gamma$ and let $\varphi := RR_0^{-1}\theta$ so note that $\varphi = \theta$ or $\varphi = -\theta$ depending on whether $R_0 = R$ or $R_0 = R^{-1}$.

Note since Ω is convex $\Omega \subset \overline{H(a_\varphi, \varphi)}$ we also know that $b_\varphi \in H(a_\varphi, \varphi)$ (since otherwise given that $\partial\Omega$ is smooth it would not be possible that $\eta_{b_\varphi} = -\varphi$), hence defining $\tau_\theta = \frac{b_\varphi - a_\varphi}{|b_\varphi - a_\varphi|}$ we have $\tau_\varphi \cdot \varphi > 0$.

Let $\tilde{m} = R(\nabla \tilde{u})$, it is easy to see that

$$\Pi_\varphi := \{ z \in \mathcal{U} \backslash \Omega : \tilde{m}(z) \cdot \varphi > 0 \} = \left\{ z \in \mathcal{U} \backslash \Omega : \nabla u\left(z\right) \cdot R^{-1}\varphi > 0 \right\} \tag{50}$$

forms a connected set whose boundary is contained in $\partial\mathcal{U}$ and $\partial\Omega$ and in two lines parallel to φ, see figure 2, also note the endpoints of $\partial\mathcal{U} \cap \overline{\Pi_\varphi}$ are given by a_φ and b_φ.

Now by Lemma 2, (41) function $\tilde{u}$ satisfies (6) and (7). Since either $\varphi = \theta \in \Gamma$ or $\varphi = -\theta \in \Gamma$ so we can apply Lemma 1, to $\tilde{m}$ and thus there exists function $w_\varphi : \mathcal{U} \to \mathbb{R}$ such that

$$\int_{\mathcal{U}} \left| \nabla w_\varphi - R\left(\Lambda_\varphi\left(\tilde{m}\right)\right) \right| \leq c\beta^{\frac{1}{8}}. \tag{51}$$

By the Co-area formula and Chebyshev's inequality there exists a set $H \subset [0, 1/10]$ such that $H^1([0, 1/10] \setminus H) \leq c\beta^{\frac{1}{24}}$ where

$$\int_{\tilde{u}^{-1}(t)} \left| \nabla w_\varphi - R\left(\Lambda_\varphi\left(\tilde{m}\right)\right) \right| dH^1 \leq c\beta^{\frac{1}{12}} \text{ for all } r \in H. \tag{52}$$

Pick $s_0 \in \left[1/10 - c\beta^{\frac{1}{24}}, 1/10 \right] \cap H$. Recall $\tau_\varphi = \frac{b_\varphi - a_\varphi}{|b_\varphi - a_\varphi|}$ and

$$\mathcal{W}_\varphi := \overline{\mathcal{U}} \cap H\left(\frac{a_\varphi + b_\varphi}{2}, R\tau_\varphi \right). \tag{53}$$

We claim that

$$\partial\mathcal{U} \cap \overline{\Pi_\varphi} = \partial\mathcal{U} \cap \overline{\mathcal{W}_\varphi}. \tag{54}$$

Since the endpoints of $\partial\mathcal{U} \cap \overline{\Pi_\varphi}$ are the same as the endpoints of $\partial\mathcal{U} \cap \overline{\mathcal{W}_\varphi}$ it is sufficient to show $H^1\left(\partial\mathcal{U} \cap \overline{\Pi_\varphi} \cap \overline{\mathcal{W}_\varphi}\right) > 0$. Let

$$\Lambda = \sup\left\{ \lambda > 0 : \left(\frac{a_\varphi + b_\varphi}{2} + \lambda R\tau_\varphi + \langle \tau_\varphi \rangle \right) \cap \partial\mathcal{U} \neq \emptyset \right\}$$

then let c_φ be the point given by $\left(\frac{a_\varphi + b_\varphi}{2} + \Lambda R\tau_\varphi + \langle \tau_\varphi \rangle \right) \cap \partial\mathcal{U}$, since $\partial\mathcal{U}$ is smooth $\eta_{c_\varphi} = R^{-1}\tau_\varphi$, so $\nabla u(c_\varphi) = R^{-1}\tau_\varphi$ and thus $\nabla u\left(c_\varphi\right) \cdot R^{-1}\varphi = R^{-1}\tau_\varphi \cdot R^{-1}\varphi = \tau_\varphi \cdot \varphi > 0$. As this inequality is strict, in a neighborhood of c_φ the same inequality will be satisfied. Thus we have $H^1\left(\partial\mathcal{U} \cap \overline{\Pi_\varphi} \cap \overline{\mathcal{W}_\varphi}\right) > 0$ and so we have established (54).

By the construction of Π_φ and $\mathcal{W}_\varphi$ by (54) we have

$$H^1\left(\partial\Omega_{s_0} \cap \overline{\Pi_\varphi} \triangle \overline{\mathcal{W}_\varphi}\right) \leq c\beta^{\frac{1}{24}}. \tag{55}$$

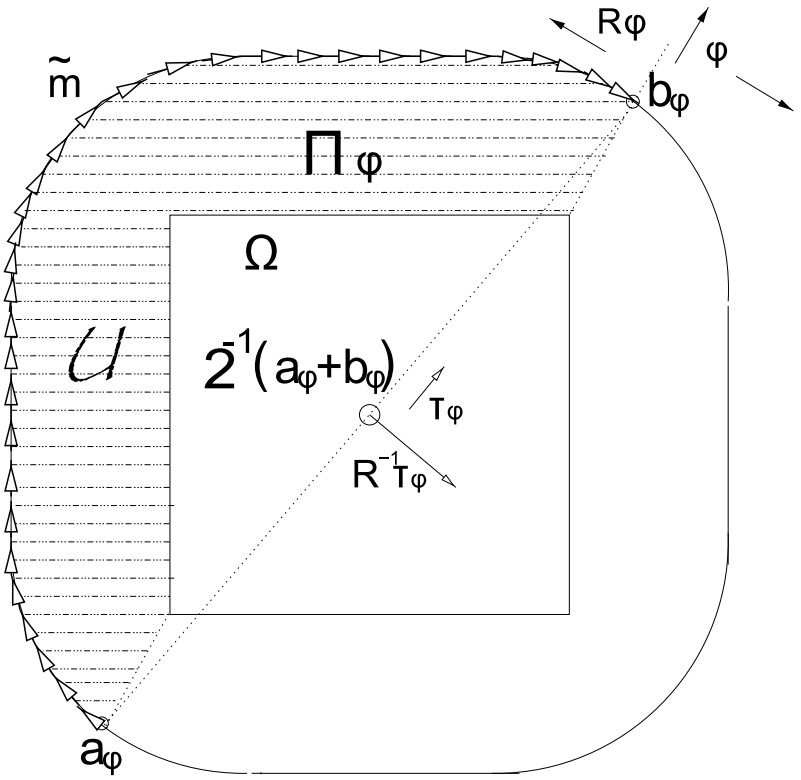

FIGURE 2.

There must exist $\psi \in (0, 2\beta^{\frac{1}{24}})$ such that defining $Q := \begin{pmatrix} \cos\psi & -\sin\psi \\ \sin\psi & \cos\psi \end{pmatrix}$ we have

$$|R\varphi \cdot Q\tau_\varphi| > \beta^{\frac{1}{24}}. \tag{56}$$

Let $\zeta_\varphi := \frac{a_\varphi + b_\varphi}{2} + \mathcal{C}_2\beta^{\frac{1}{24}} R\tau_\varphi$. From the construction it is clear that we can chose constant $\mathcal{C}_2$ large enough so that

$$\mathrm{Card}\left(\partial\Omega_{s_0} \cap H\left(\frac{a_\varphi + b_\varphi}{2}, R\tau_\varphi\right) \cap \{\zeta_\varphi + \langle Q\tau_\varphi\rangle\}\right) = 2.$$

Now for every $t > 0$ for which $\partial\Omega_{s_0} \cap \{\zeta_\varphi + tR\tau_\varphi + \langle Q\tau_\varphi\rangle\} \neq \emptyset$ let ϱ_t^1, ϱ_t^2 be the points defined by $\{\varrho_t^1, \varrho_t^2\} = \partial\Omega_{s_0} \cap \{\zeta_\varphi + tR\tau_\varphi + \langle Q\tau_\varphi\rangle\}$ and $\varrho_t^2 \cdot \varphi \geq \varrho_t^1 \cdot \varphi$. By (55) we can assume constant $\mathcal{C}_2$ was chosen large enough so that $\varrho_t^1, \varrho_t^2 \in \Pi_\varphi$. Let Σ_t be the connected component

of $\partial\Omega_{s_0}\setminus\left\{\varrho_t^1,\varrho_t^2\right\}$ that lies inside Π_φ. Thus

$$\begin{aligned}\left|(w_\varphi(\varrho_t^2)-w_\varphi(\varrho_t^1))-(\varrho_t^2-\varrho_t^1)\cdot R\varphi\right| &= \left|\int_{\Sigma_t}\nabla w_\varphi(z)\cdot t_z dH^1 z-\int_{\Sigma_t}R\varphi\cdot t_z dH^1 z\right| \\ &= \left|\int_{\Sigma_t}(\nabla w_\varphi(z)-R\varphi)\cdot t_z dH^1 z\right| \\ &\overset{(52)}{\leq} c\beta^{\frac{1}{12}}. \end{aligned} \tag{57}$$

Let

$$e_t=\int_{[\varrho_t^1,\varrho_t^2]}\left|\nabla w_\varphi-R\left(\Lambda_\varphi(\tilde{m})\right)\right|, \tag{58}$$

so by the fundamental theorem of Calculus $\left|\left(w_\varphi(\varrho_t^2)-w_\varphi(\varrho_t^1)\right)-\int_{[\varrho_t^1,\varrho_t^2]}R\left(\Lambda_\varphi(\tilde{m})\right)\cdot Q\tau_\varphi\right|\leq e_t$. Thus in combination with (57) we have

$$\left|\left(\varrho_t^2-\varrho_t^1\right)\cdot R\varphi-\int_{[\varrho_t^1,\varrho_t^2]}R\left(\Lambda_\varphi(\tilde{m})\right)\cdot Q\tau_\varphi\right|\leq e_t+c\beta^{\frac{1}{12}}. \tag{59}$$

Given the definition of Λ_φ (see (17)) and of $\mathcal{G}_\theta^{R_0}$ (see the statement of Lemma 3) so

$$R(\Lambda_\varphi(\tilde{m}(x)))=R\varphi\Leftrightarrow\tilde{m}(x)\cdot\varphi>0\Leftrightarrow\nabla\tilde{u}(x)\cdot R^{-1}\varphi>0\Leftrightarrow\nabla\tilde{u}(x)\cdot R_0^{-1}\theta>0\Leftrightarrow x\in\mathcal{G}_\theta^{R_0}.$$

In exactly the same way $\Lambda_\varphi(\tilde{m}(x))=0\Leftrightarrow x\notin\mathcal{G}_\theta^{R_0}$. Hence

$$\int_{[\varrho_t^1,\varrho_t^2]}\Lambda_\varphi(\tilde{m}(x))dH^1x=\varphi H^1\left(\left[\varrho_t^1,\varrho_t^2\right]\cap\mathcal{G}_\theta^{R_0}\right)$$

which from (59)

$$\left|\left(\varrho_t^2-\varrho_t^1\right)\cdot R\varphi-Q\tau_\varphi\cdot R\varphi H^1\left(\left[\varrho_t^1,\varrho_t^2\right]\cap\mathcal{G}_\theta^{R_0}\right)\right|\leq e_t+c\beta^{\frac{1}{12}}$$

since (recall (56)) we chose Q so that $|R\varphi\cdot Q\tau_\varphi|>\beta^{\frac{1}{24}}$ and since $\frac{\varrho_t^2-\varrho_t^1}{|\varrho_t^2-\varrho_t^1|}=Q\tau_\varphi$ so

$$\left|\left|\varrho_t^2-\varrho_t^1\right|-H^1\left(\left[\varrho_t^1,\varrho_t^2\right]\cap\mathcal{G}_\theta^{R_0}\right)\right|\leq c\beta^{-\frac{1}{24}}e_t+c\beta^{\frac{1}{24}}.$$

To simplify notation let $\vartheta=H^1\left(P_{\langle R(Q\tau_\varphi)\rangle}\left(\Omega_{s_0}\cap H(\zeta_\varphi,R(Q\tau_\varphi))\right)\right)$

$$H^1\left(\left[\varrho_t^1,\varrho_t^2\right]\cap\mathcal{G}_\theta^{R_0}\right)\geq\left|\varrho_t^1-\varrho_t^2\right|-c\beta^{-\frac{1}{24}}e_t-c\beta^{\frac{1}{24}}\text{ for any }t\in[0,\vartheta]. \tag{60}$$

So

$$\begin{aligned}\left|\Omega_{s_0}\cap H\left(\zeta_\varphi,R\left(Q\tau_\varphi\right)\right)\cap\mathcal{G}_\theta^{R_0}\right| &= \int_{[0,\vartheta]}H^1\left(\left[\varrho_t^1,\varrho_t^2\right]\cap\mathcal{G}_\varphi^{R_0}\right)dt \\ &\overset{(60)}{\geq} \int_{[0,\vartheta]}\left|\varrho_t^1-\varrho_t^2\right|-c\beta^{-\frac{1}{24}}e_t-c\beta^{\frac{1}{24}} \\ &\overset{(58)}{\geq} \left|\Omega_{s_0}\cap H\left(\zeta_\varphi,R\left(Q\tau_\varphi\right)\right)\right|-c\beta^{\frac{1}{24}} \\ &\quad -c\beta^{-\frac{1}{24}}\int_{\mathcal{U}}\left|\nabla w_\varphi-R\left(\Lambda_\varphi\left(\tilde{m}\right)\right)\right| \\ &\overset{(51)}{\geq} \left|\Omega_{s_0}\cap H\left(\zeta_\varphi,R\left(Q\tau_\varphi\right)\right)\right|-c\beta^{\frac{1}{24}}. \end{aligned} \tag{61}$$

Note $|\mathcal{U}\backslash\Omega_{s_0}|\leq c\beta^{\frac{1}{24}}$ and by definition of $\mathcal{W}_\varphi$ (see (53)) $|\mathcal{W}_\varphi\backslash H\left(\zeta_\varphi,R\left(Q\tau_\varphi\right)\right)|\leq c\beta^{\frac{1}{24}}$ this gives $\left|\mathcal{W}_\varphi\backslash\mathcal{G}_\theta^{R_0}\right|\leq c\beta^{\frac{1}{24}}$. Now if $R_0=R$ and so $\varphi=\theta$, it is imediate that $\tau_\varphi=\frac{b_\theta-a_\theta}{|b_\theta-a_\theta|}$ and so (again recalling definition (53)) (48) follows. On the other hand if $R_0=R^{-1}$ then $\varphi=-\theta$ and

so $a_\varphi = b_\theta$, $b_\varphi = a_\theta$, which implies $\tau_\varphi = -\frac{b_\theta - a_\theta}{|b_\theta - a_\theta|}$ so $R\tau_\varphi = R\left(-\frac{b_\theta - a_\theta}{|b_\theta - a_\theta|}\right) = R^{-1}\left(\frac{b_\theta - a_\theta}{|b_\theta - a_\theta|}\right) = R_0\left(\frac{b_\theta - a_\theta}{|b_\theta - a_\theta|}\right)$ hence (again recalling definition (53)),(48) also follows in this case. □

Lemma 4. *Let Ω be a convex body centered on 0 with $\operatorname{diam}(\Omega) = 2$. Let $u : W^{2,2}(\Omega) \to \mathbb{R}$ be a function satisfying (6) and (7) and in addition u satisfies $u = 0$ on $\partial\Omega$ and $\nabla u(z)\cdot\eta_z = 1$ on $\partial\Omega$ in the sense of trace where η_z is the inward pointing unit normal to $\partial\Omega$ at z. Let $a, b \in \Omega$ be such that $\operatorname{diam}(\Omega) = |a - b|$ we will show there exists constant $\mathcal{C}_3 > 1$ and $r_0 \in (\mathcal{C}_3^{-1}\beta^{\frac{1}{256}}, \mathcal{C}_3\beta^{\frac{1}{256}})$ such that*

$$u(x) \geq 1 - \mathcal{C}_3\beta^{\frac{1}{256}} \text{ for any } x \in \partial B_{r_0}\left(\frac{a+b}{2}\right). \tag{62}$$

Proof of Lemma 4. Let $\mathcal{U}$ be the convex set and $\tilde{u}$ be the function constructed in Lemma 3. It is easy to see we can chose $\tilde{a}, \tilde{b} \in \mathcal{U}$ such that $\frac{\tilde{a}-\tilde{b}}{|\tilde{a}-\tilde{b}|} = \frac{a-b}{|a-b|}$ and $\left|\tilde{a} - \tilde{b}\right| = \operatorname{diam}(\mathcal{U})$. Without loss of generality assume $\frac{\tilde{a}-\tilde{b}}{|\tilde{a}-\tilde{b}|} = e_2$.

Step 1. Let $P : \left[0, H^1(\partial\mathcal{U})\right) \to \partial\mathcal{U}$ be a 'clockwise' parameterisation of $\mathcal{U}$ by arclength with $P(0) = \tilde{a}$. Let $\sigma_1 = P(H^1(\partial\mathcal{U}) - \beta^{\frac{1}{256}})$ and $\sigma_2 = P(\beta^{\frac{1}{256}})$, see figure 3. The points σ_1, σ_2 satisfy the following properties, firstly

$$\eta_{\sigma_i}\cdot(-e_2) \geq 1 - c\beta^{\frac{1}{128}} \text{ for } i = 1, 2. \tag{63}$$

Secondly

$$|\sigma_1 - \sigma_2| \leq 2\beta^{\frac{1}{256}}. \tag{64}$$

Thirdly

$$\sigma_1\cdot(-e_1) \geq \frac{\beta^{\frac{1}{256}}}{2} \text{ and } \sigma_2\cdot e_1 \geq \frac{\beta^{\frac{1}{256}}}{2}. \tag{65}$$

Proof of Step 1. Recall $\mathcal{U} = \Omega_{\frac{1}{10}}(\Omega)$, so for any $x \in \partial\mathcal{U}$ let $z_x \in \partial\Omega$ be such that $d(x, \Omega) = |x - z_x|$, note that we can inscribe a ball $B_{\frac{1}{10}}(z_x) \subset \mathcal{U}$ with $x \in \partial B_{\frac{1}{10}}(z_x) \cap \partial\mathcal{U}$ and $B_{\frac{1}{10}}(z_x) \cap \partial\mathcal{U} = \emptyset$. Thus the curvature of $\partial\mathcal{U}$ is bounded above by 10 and so $\|\ddot{P}\|_{L^\infty(\partial\mathcal{U})} \leq 10$. Since $\dot{P}(\tilde{a}) = e_1$, $\left|\dot{P}(\tilde{a}) - \dot{P}(\beta^{\frac{1}{256}})\right| \leq 10\beta^{\frac{1}{256}}$ and as $\eta_{\sigma_2} = R^{-1}(\dot{P}(\beta^{\frac{1}{256}}))$ this proves (63) for $i = 2$. The proof for $i = 1$ follows the same way.

Inequality (64) follows instantly since σ_1 and σ_2 is connected by a path of length less than $2\beta^{\frac{1}{256}}$. Now from for any $t \in [0, \beta^{\frac{1}{256}}]$ we have

$$\left|e_1 - \dot{P}(t)\right| = \left|\dot{P}(0) - \dot{P}(t)\right| \leq \int_0^t \left|\ddot{P}(s)\right| ds \leq 10\beta^{\frac{1}{256}}.$$

Thus $\sigma_2\cdot e_1 = (\sigma_2 - \tilde{a})\cdot e_1 = \int_0^{\beta^{\frac{1}{256}}} \dot{P}(s)\cdot e_1 ds \geq (1 - 10\beta^{\frac{1}{256}})\beta^{\frac{1}{256}}$. Arguing in exactly the same way $(-e_1)\cdot\sigma_1 \geq (1 - 10\beta^{\frac{1}{256}})\beta^{\frac{1}{256}}$ which establishes (65).

Step 2. We will show there exists positive constant $\mathcal{C}_4$ and $x_0 \in N_{\mathcal{C}_4\beta^{\frac{1}{256}}}\left(\left[\tilde{a}, \tilde{b}\right]\right) \cap \mathcal{U}$ such that for some $\psi_0 \in B_{\mathcal{C}_4\beta^{\frac{1}{256}}}(e_2)$ the following inequality holds

$$\left|X\left(x_0, \psi_0, \mathcal{C}_4\beta^{\frac{1}{256}}\right) \cap \mathcal{U} \backslash \left\{x : |\nabla\tilde{u}(x)\cdot e_1| < \mathcal{C}_4\beta^{\frac{1}{256}}\right\}\right| \leq \mathcal{C}_4\beta^{\frac{1}{24}}. \tag{66}$$

Proof of Step 2. Without loss of generality we can assume σ_1 and σ_2 are chosen so that $\eta_{\sigma_1} \in \Xi$ and $\eta_{\sigma_2} \in \Xi$ (recall the definition of Ξ, see (49)). We also know $\eta_{\tilde{a}} = -e_2$ and $\eta_{\tilde{b}} = e_2$. Let $\omega_1 \in \partial\mathcal{U}$ be the unique point for which $-\eta_{\omega_1} = \eta_{\sigma_1}$ and let $\omega_2 \in \partial\mathcal{U}$ be the unique point for which $-\eta_{\omega_2} = \eta_{\sigma_2}$, see figure 3.

Define

$$\Pi_2 := H\left(\frac{\sigma_2+\omega_2}{2}, R\left(\frac{\omega_2-\sigma_2}{|\omega_2-\sigma_2|}\right)\right) \cap H\left(\frac{\sigma_1+\omega_1}{2}, R^{-1}\left(\frac{\omega_1-\sigma_1}{|\omega_1-\sigma_1|}\right)\right) \tag{67}$$

and

$$\Pi_1 := H\left(\frac{\sigma_2+\omega_2}{2}, R^{-1}\left(\frac{\omega_2-\sigma_2}{|\omega_2-\sigma_2|}\right)\right) \cap H\left(\frac{\sigma_1+\omega_1}{2}, R\left(\frac{\omega_1-\sigma_1}{|\omega_1-\sigma_1|}\right)\right) \tag{68}$$

and let $\Pi = \Pi_1 \cup \Pi_2$ and let $x_0 := \overline{\Pi_1} \cap \overline{\Pi_2}$, see figure 3.

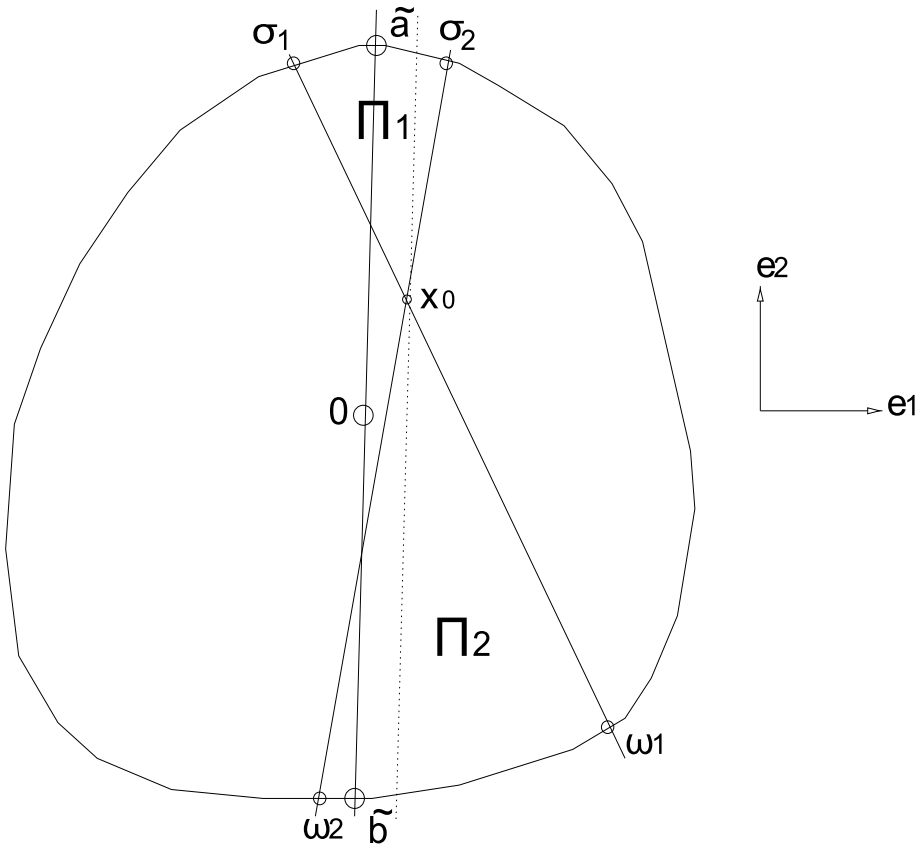

FIGURE 3.

Let us define $l_x^\theta := x + \mathbb{R}_+\theta$ for any $x \in \mathbb{R}^2$, $\theta \in S^1$. First we will show $(x_0 + \mathbb{R}e_2) \subset \Pi$ however this inclusion is relatively easy to see because firstly

$$e_2 \cdot R\left(\frac{\omega_1-\sigma_1}{|\omega_1-\sigma_1|}\right) = e_1 \cdot \left(\frac{\omega_1-\sigma_1}{|\omega_1-\sigma_1|}\right) \geq \frac{\beta^{\frac{1}{256}}}{4}$$

thus $l_0^{e_2} \subset H\left(0, R\left(\frac{\omega_1-\sigma_1}{|\omega_1-\sigma_1|}\right)\right)$. And secondly as $x_0 \in \partial H\left(\frac{\sigma_1+\omega_1}{2}, R\left(\frac{\omega_1-\sigma_1}{|\omega_1-\sigma_1|}\right)\right)$

$$l_{x_0}^{e_2} \subset H\left(x_0, R\left(\frac{\omega_1-\sigma_1}{|\omega_1-\sigma_1|}\right)\right) = H\left(\frac{\sigma_1+\omega_1}{2}, R\left(\frac{\omega_1-\sigma_1}{|\omega_1-\sigma_1|}\right)\right).$$

In exactly the same way $l_{x_0}^{e_2} \subset H\left(\frac{\sigma_2+\omega_2}{2}, R^{-1}\left(\frac{\omega_2-\sigma_2}{|\omega_2-\sigma_2|}\right)\right)$. Hence $l_{x_0}^{e_2} \subset \Pi_1$. Arguing in the same manner we have $l_{x_0}^{-e_2} \subset \Pi_2$ and thus we have established the claim.

Let $\gamma = l_{x_0}^{e_2} \cap \partial\mathcal{U}$, by construction we have that γ lies in the component of $\partial\mathcal{U}$ between σ_1 and σ_2 and hence we know $d\left(\gamma, l_0^{e_2}\right) \leq c\beta^{\frac{1}{256}}$ and so it follows $x_0 \in N_{c\beta^{\frac{1}{256}}}\left(\left[\tilde{a}, \tilde{b}\right]\right) \cap \mathcal{U}$.

Since $\eta_{\tilde{a}} = -e_2$, $\eta_{\tilde{b}} = e_2$ and $\mathcal{U}$ is convex we know $\omega_2 \in H(0, -e_1)$ and for the same reasons $\omega_1 \in H(0, e_1)$ see figure 3. So $(\sigma_2 - \omega_2) \cdot e_1 \geq \sigma_2 \cdot e_1 \geq c\beta^{\frac{1}{256}}$ and for exactly the same reason $(\sigma_1 - \omega_1) \cdot (-e_1) \geq \sigma_2 \cdot (-e_1) \geq c\beta^{\frac{1}{256}}$. Thus as $|\sigma_1 - \omega_1| \leq 2\text{diam}(\mathcal{U})$ and $|\sigma_2 - \omega_2| \leq 2\text{diam}(\mathcal{U})$ we have $\frac{\sigma_2-\omega_2}{|\sigma_2-\omega_2|} \cdot e_1 \geq c\beta^{\frac{1}{256}}$ and $\frac{\sigma_1-\omega_1}{|\sigma_1-\omega_1|} \cdot (-e_1) \geq c\beta^{\frac{1}{256}}$. Hence

$$\begin{aligned}\left(\frac{\sigma_1-\omega_1}{|\sigma_1-\omega_1|}\right) \cdot \left(\frac{\sigma_2-\omega_2}{|\sigma_2-\omega_2|}\right) &= \left(\frac{\sigma_1-\omega_1}{|\sigma_1-\omega_1|} \cdot e_1\right)\left(\frac{\sigma_2-\omega_2}{|\sigma_2-\omega_2|} \cdot e_1\right) \\ &\quad + \left(\frac{\sigma_1-\omega_1}{|\sigma_1-\omega_1|} \cdot e_2\right)\left(\frac{\sigma_2-\omega_2}{|\sigma_2-\omega_2|} \cdot e_2\right) \\ &\leq -c\beta^{\frac{1}{128}} + 1.\end{aligned}$$

In other words the angle between $\frac{\sigma_1-\omega_1}{|\sigma_1-\omega_1|}$ and $\frac{\sigma_2-\omega_2}{|\sigma_2-\omega_2|}$ is greater than $\mathcal{C}_4\beta^{\frac{1}{256}}$ for some positive constant $\mathcal{C}_4$. Thus there exists $\psi_0 \in B_{c\beta^{\frac{1}{256}}}(e_2)$ such that $X\left(x_0, \psi_0, \mathcal{C}_4\beta^{\frac{1}{256}}\right) \subset \Pi$. By Lemma 3 we know that

$$\left|\mathcal{U} \cap H\left(\frac{\sigma_2+\omega_2}{2}, R^{-1}\left(\frac{\omega_2-\sigma_2}{|\omega_2-\sigma_2|}\right)\right) \backslash \mathcal{G}_{\eta_{\sigma_2}}^{R^{-1}}\right| \leq c\beta^{\frac{1}{24}}$$

and

$$\left|\mathcal{U} \cap H\left(\frac{\sigma_1+\omega_1}{2}, R\left(\frac{\omega_1-\sigma_1}{|\omega_1-\sigma_1|}\right)\right) \backslash \mathcal{G}_{\eta_{\sigma_1}}^{R}\right| \leq c\beta^{\frac{1}{24}}.$$

Thus (recalling the definition of Π_1, (68))

$$\left|\Pi_1 \cap \mathcal{U} \backslash \mathcal{G}_{\eta_{\sigma_2}}^{R^{-1}} \cap \mathcal{G}_{\eta_{\sigma_1}}^{R}\right| \leq c\beta^{\frac{1}{24}}. \tag{69}$$

In exactly the same way we have (recall (67))

$$\left|\Pi_2 \cap \mathcal{U} \backslash \mathcal{G}_{\eta_{\sigma_1}}^{R^{-1}} \cap \mathcal{G}_{\eta_{\sigma_2}}^{R}\right| \leq c\beta^{\frac{1}{24}}. \tag{70}$$

Now for any $x \in \mathcal{G}_{\eta_{\sigma_2}}^{R^{-1}} \cap \mathcal{G}_{\eta_{\sigma_1}}^{R}$ we have $\nabla\tilde{u}(x) \cdot R\eta_{\sigma_2} \geq 0$ and $\nabla\tilde{u}(x) \cdot R^{-1}\eta_{\sigma_1} \geq 0$. Since from (63) $\eta_{\sigma_i} \in X^+\left(0, -e_2, c\beta^{\frac{1}{256}}\right)$ for $i = 1, 2$ we know $R\eta_{\sigma_2} \in X^+\left(0, e_1, c\beta^{\frac{1}{256}}\right)$ and $R^{-1}\eta_{\sigma_1} \in X^+\left(0, -e_1, \beta^{\frac{1}{256}}\right)$, from this it is easy to see (assuming we chose $\mathcal{C}_4$ large enough)$|\nabla\tilde{u}(x) \cdot e_1| \leq \mathcal{C}_4\beta^{\frac{1}{256}}$. And in the same way for any $x \in \mathcal{G}_{\eta_{\sigma_1}}^{R^{-1}} \cap \mathcal{G}_{\eta_{\sigma_2}}^{R}$ we also have $|\nabla\tilde{u}(x) \cdot e_1| \leq \mathcal{C}_4\beta^{\frac{1}{256}}$.

$$\begin{aligned}&\left|X\left(x_0, \psi_0, \mathcal{C}_4\beta^{\frac{1}{256}}\right) \cap \mathcal{U} \backslash \left\{x : |\nabla u(x) \cdot e_1| < \mathcal{C}_4\beta^{\frac{1}{256}}\right\}\right| \\ &\quad \leq c\left|\Pi_1 \cap \mathcal{U} \backslash \mathcal{G}_{\eta_{\sigma_1}}^{R} \cap \mathcal{G}_{\eta_{\sigma_2}}^{R^{-1}}\right| + c\left|\Pi_2 \cap \mathcal{U} \backslash \mathcal{G}_{\eta_{\sigma_2}}^{R} \cap \mathcal{G}_{\eta_{\sigma_1}}^{R^{-1}}\right| \\ &\quad \leq \mathcal{C}_4\beta^{\frac{1}{24}}\end{aligned}$$

which establishes (66).

Step 3. There exists positive constant $\mathcal{C}_5$ such that for some $v_1 \in \{e_2, -e_2\}$ we have

$$\left| X\left(x_0, \psi_0, \mathcal{C}_4 \beta^{\frac{1}{256}}\right) \cap \mathcal{U} \cap H\left(\mathcal{C}_5 \beta^{\frac{1}{256}} v_1, v_1\right) \setminus \mathbb{V}_{-v_1} \right| \leq \mathcal{C}_5 \beta^{\frac{1}{24}}. \tag{71}$$

where

$$\mathbb{V}_{-v_1} := \left\{ x \in \mathcal{U} : \nabla u\left(x\right) \in N_{\mathcal{C}_5 \beta^{\frac{1}{256}}}\left(-v_1\right) \right\}. \tag{72}$$

Proof of Step 3. Let $\varpi_0 = l_0^{-e_1} \cap \partial \mathcal{U}$. Note since $\mathcal{U}$ is convex $\eta_{\varpi_0} \cdot e_1 > 0$. We claim

$$\eta_{\varpi_0} \cdot e_1 > \frac{1}{10}. \tag{73}$$

Suppose this were not the case, then $\eta_{\varpi_0} \cdot e_1 \leq \frac{1}{10}$. Since $\mathcal{U}$ is convex and $\operatorname{diam}(\mathcal{U}) < 2$ we know $\mathcal{U} \subset \overline{H\left(\varpi_0, \eta_{\varpi_0}\right)} \subset H\left(-2e_1, \eta_{\varpi_0}\right)$ which implies $\left(\tilde{b} + 2e_1\right) \cdot \eta_{\varpi_0} > 0$ and thus

$$\tilde{b} \cdot e_2 \sqrt{\frac{99}{100}} \geq \left(\left(\tilde{b} + 2e_1\right) \cdot e_2\right)\left(\eta_{\varpi_0} \cdot e_2\right) > -\left(\left(\tilde{b} + 2e_1\right) \cdot e_1\right)\left(\eta_{\varpi_0} \cdot e_1\right) = -2\eta_{\varpi_0} \cdot e_1 \geq -\frac{1}{5}$$

however as $\left|\tilde{a} - \tilde{b}\right| = \operatorname{diam}(\mathcal{U}) = \frac{22}{10}$, $\frac{\tilde{a}+\tilde{b}}{2} = 0$ and $\frac{\tilde{a}-\tilde{b}}{\left|\tilde{a}-\tilde{b}\right|} = e_2$ this is a contradiction.

Let $\varpi_1 \in \partial \mathcal{U}$ a point for which $\eta_{\varpi_1} = -\eta_{\varpi_0}$. Now let $l \in \left(\frac{\varpi_1 - \varpi_0}{|\varpi_1 - \varpi_0|}\right)^{\perp} \cap S^1$ be such that

$$H^1\left([a,b] \cap H\left(\frac{\varpi_1 + \varpi_0}{2}, l\right)\right) \geq \frac{|a-b|}{2}. \tag{74}$$

Chose $S \in \left\{R^{-1}, R\right\}$ so that $S\left(\frac{\varpi_1 - \varpi_0}{|\varpi_1 - \varpi_0|}\right) = l$, by Lemma 3 we have

$$\left| \mathcal{U} \cap H\left(\frac{\varpi_1 + \varpi_0}{2}, l\right) \setminus \mathcal{G}^S_{\eta_{\varpi_0}} \right| \leq c\beta^{\frac{1}{24}}. \tag{75}$$

From (7) and (66) we know

$$\left| X\left(x_0, \psi_0, \mathcal{C}_4 \beta^{\frac{1}{256}}\right) \cap \mathcal{U} \setminus \left\{x : \nabla \tilde{u}(x) \in N_{100^{-1}}(\{e_2, -e_2\})\right\} \right| \leq c\beta^{\frac{1}{24}}. \tag{76}$$

Since so $\left|S^{-1}\eta_{\varpi_0} \cdot e_2\right| \overset{(73)}{>} 10^{-1}$ there exists some fixed vector $v_0 \in \{e_2, -e_2\}$ such that if $x \in \mathcal{G}^S_{\eta_{\varpi_0}} \cap \left\{x : \nabla \tilde{u}\left(x\right) \in N_{100^{-1}}\left(\{e_2, -e_2\}\right)\right\}$ then $\nabla \tilde{u}\left(x\right) \in B_{100^{-1}}\left(v_0\right)$ and so using (75) and (76)

$$\left| X\left(x_0, \psi_0, \mathcal{C}_4 \beta^{\frac{1}{256}}\right) \cap \mathcal{U} \cap H\left(\frac{\varpi_1 + \varpi_0}{2}, l\right) \setminus \left\{x : \nabla \tilde{u}(x) \in B_{100^{-1}}\left(v_0\right)\right\} \right| \leq c\beta^{\frac{1}{24}}. \tag{77}$$

Now for any $w \in H\left(0, v_0\right)$ we have the elementary inequality $|w - v_0| \leq 4d(w, S^1) + |w \cdot e_1|$, so using (7), (66) and (77) we have (assuming constant $\mathcal{C}_5$ is large enough, recall definition (72))

$$\left| X\left(x_0, \psi_0, \mathcal{C}_4 \beta^{\frac{1}{256}}\right) \cap \mathcal{U} \cap H\left(\frac{\varpi_1 + \varpi_0}{2}, l\right) \setminus \mathbb{V}_{v_0} \right| \leq c\beta^{\frac{1}{24}}. \tag{78}$$

Recall $\varpi_0 = l_0^{-e_1} \cap \partial \mathcal{U}$ so as $B_{\frac{1}{10}}(0) \subset \mathcal{U}$ we have that $\varpi_0 \cdot (-e_1) > \frac{1}{10}$. Now either $\varpi_1 \cdot e_1 > -\frac{1}{20}$ and so $\left|\frac{\varpi_0 - \varpi_1}{|\varpi_0 - \varpi_1|} \cdot e_1\right| \geq \frac{1}{40}$ and so $|l \cdot e_2| \geq \frac{1}{40}$. Thus by the fact that $\psi_0 \in B_{\mathcal{C}_4 \beta^{\frac{1}{256}}}(e_2)$ and that inequality (74) implies $0 \in \overline{H(\frac{\varpi_1 + \varpi_0}{2}, l)}$ there exists $v_1 \in \{e_2, -e_2\}$ such that for some constant $\mathcal{C}_5$ we have

$$X\left(x_0, \psi_0, \mathcal{C}_4 \beta^{\frac{1}{256}}\right) \cap H\left(\mathcal{C}_5 \beta^{\frac{1}{256}} v_1, v_1\right) \subset H\left(\frac{\varpi_1 + \varpi_0}{2}, l\right). \tag{79}$$

On the other hand if $\varpi_1 \cdot e_1 \leq -\frac{1}{20}$ then by (74) we know $H\left(\frac{\varpi_1 + \varpi_0}{2}, l\right)$ is the larger part of $\mathcal{U}$ and indeed $X\left(x_0, \psi_0, \mathcal{C}_4 \beta^{\frac{1}{256}}\right) \cap \mathcal{U}$ will be fully contained in $H\left(\frac{\varpi_1 + \varpi_0}{2}, l\right)$ and this also implies (79).

Putting (79) together with (78) gives

$$\left|X\left(x_0,\psi_0,\mathcal{C}_4\beta^{\frac{1}{256}}\right)\cap\mathcal{U}\cap H\left(\mathcal{C}_5\beta^{\frac{1}{256}}v_1,v_1\right)\setminus\mathbb{V}_{v_0}\right|\leq c\beta^{\frac{1}{24}}.$$

Let $x\in\mathcal{U}\setminus\overline{\Omega}\cap X\left(x_0,\psi_0,\mathcal{C}_4\beta^{\frac{1}{256}}\right)\cap H(\mathcal{C}_5\beta^{\frac{1}{256}}v_1,v_1)$ so as $\tilde{u}(x)=d(x,\partial\mathcal{U})$ and since $\psi_0\in B_{\mathcal{C}_4\beta^{\frac{1}{256}}}(e_2)$ so $\nabla\tilde{u}(x)\in N_{\mathcal{C}_5\beta^{\frac{1}{256}}}(-v_1)$ thus we must have $v_0=-v_1$, this gives (71).

Step 4. We will show there exists a positive constant $\mathcal{C}_6$ such that

$$\left(l_x^{-\theta}\cup l_x^{\theta}\right)\setminus B_{\mathcal{C}_6\beta^{\frac{1}{128}}}(x)\subset X(x_0,\psi_0,\mathcal{C}_4\beta^{\frac{1}{256}})\text{ for all }x\in B_{\frac{1}{128}}(x_0),\theta\in S^1\cap B_{\beta^{\frac{1}{128}}}(\psi_0).\quad(80)$$

Proof of Step 4. Without loss of generality we assume $x_0=0$, $\psi_0=e_2$ and $\mathcal{C}_4=1$. To begin with to take point $x=\beta^{\frac{1}{128}}e_1$, we will show later the general case follows from this. See figure 4.

Let $\theta=\begin{pmatrix}\sin\beta^{\frac{1}{128}}\\ \cos\beta^{\frac{1}{128}}\end{pmatrix}$ and let $y=\partial X(0,e_2,\beta^{\frac{1}{256}})\cap l_x^{\theta}$. We will get an upper bound on $|y|$. Let $z=y\cdot e_1e_1$. We have two triangles to calculate with, triangle T_1 with corners on $0,x,y$ which is a subset of triangle T_2 with corners on $0,z,y$. Note that by applying the law of sins we have $|y|^{-1}\sin(\frac{\pi}{2}+\beta^{\frac{1}{128}})=|x-y|^{-1}\sin(\frac{\pi}{2}-\beta^{\frac{1}{256}})$. Note that $T_3=T_2\setminus T_1$ is also a right angle triangle and since $|z|=\beta^{\frac{1}{128}}+|x-z|$ we have $|y|\cos(\frac{\pi}{2}-\beta^{\frac{1}{256}})=\beta^{\frac{1}{128}}+|y-x|\cos(\frac{\pi}{2}-\beta^{\frac{1}{128}})$. Putting this together with the previous equation we have $|y|\sin\beta^{\frac{1}{256}}=\beta^{\frac{1}{128}}+|y|\frac{\cos\beta^{\frac{1}{256}}}{\cos\beta^{\frac{1}{128}}}\sin\beta^{\frac{1}{128}}$ which gives $|y|\left(\sin\beta^{\frac{1}{256}}-\frac{\cos\beta^{\frac{1}{256}}}{\cos\beta^{\frac{1}{128}}}\sin\beta^{\frac{1}{128}}\right)=\beta^{\frac{1}{128}}$. Now by taking the Taylor series approximating sin and cos we have $|y|\left(\beta^{\frac{1}{256}}+O\left(\beta^{\frac{1}{128}}\right)\right)=\beta^{\frac{1}{128}}$. Thus $|y|\sim\beta^{\frac{1}{256}}$ and thus the existence of constant $\mathcal{C}_6$ such that (80) holds follows instantly for the case $x=\beta^{\frac{1}{128}}e_1$.

In the general case where $x\neq\beta^{\frac{1}{128}}e_1$ suppose without loss of generality $x\cdot e_1>0$, define $\tilde{x}=(x+\langle\theta\rangle)\cap\langle e_1\rangle$, since the angle between θ and e_1 is with $c\beta^{\frac{1}{256}}$ of $\frac{\pi}{2}$ it is easy to see $\tilde{x}\in B_{2\beta^{\frac{1}{128}}}(0)$ and of course $l_{\tilde{x}}^{\theta}\cap\partial X(0,e_2,\beta^{\frac{1}{256}})=l_x^{\theta}\cap\partial X(0,e_2,\beta^{\frac{1}{256}})$ so the argument for the special case $x=\beta^{\frac{1}{128}}e_1$ can be applied to show the existence of constant $\mathcal{C}_6$ satisfying (80).

Step 5. We will establish (62).

Proof of Step 5. Let

$$h(z):=\mathbb{1}_{X\left(x_0,\psi_0,\mathcal{C}_4\beta^{\frac{1}{256}}\right)\cap H\left(\mathcal{C}_5\beta^{\frac{1}{256}}v_1,v_1\right)\cap\mathcal{U}\setminus\mathbb{V}_{-v_1}}\quad(81)$$

so we know $\int h\overset{(71)}{\leq}c\beta^{\frac{1}{24}}$. So by the Fubini's Theorem

$$\begin{aligned}\int_{\mathcal{U}}\int_{\mathcal{U}}&\left(h(z)+\beta^{-1}\left|1-|\nabla\tilde{u}(z)|^2\right|^2\right)|z-x|^{-1}\,dzdx\\&\leq\int_{\mathcal{U}}\left(h(z)+\beta^{-1}\left|1-|\nabla\tilde{u}(z)|^2\right|^2\right)\left(\int|z-x|^{-1}\,dx\right)dz\\&\leq c\int_{\mathcal{U}}\left(h(z)+\beta^{-1}\left|1-|\nabla\tilde{u}(z)|^2\right|^2\right)dz\\&\overset{(7)}{\leq}c\beta^{\frac{1}{24}}.\end{aligned}\quad(82)$$

Let

$$G:=\left\{x\in B_{\beta^{\frac{1}{128}}}(x_0):\int_{\mathcal{U}}\left(h(z)+\beta^{-1}\left|1-|\nabla\tilde{u}(z)|^2\right|^2\right)|z-x|^{-1}\,dz\leq c\beta^{\frac{1}{48}}\right\}\quad(83)$$

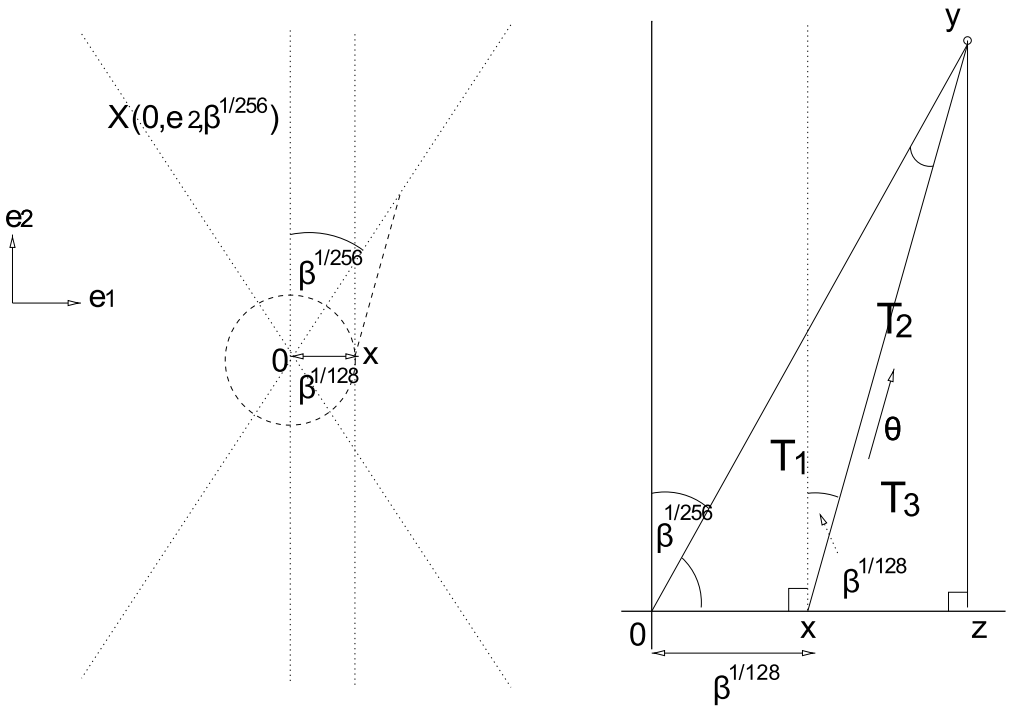

FIGURE 4.

so we know $\beta^{\frac{1}{48}}\left|B_{\beta^{\frac{1}{128}}}(x_0)\backslash G\right| \leq c\beta^{\frac{1}{24}}$, thus $\left|B_{\beta^{\frac{1}{128}}}(x_0)\backslash G\right| \leq c\beta^{\frac{1}{48}}$, assuming β is small enough $|G| \geq 2^{-1}\beta^{\frac{1}{64}}$. By Step 4, (80) for any $x \in B_{\beta^{\frac{1}{128}}}(x_0)$, $\theta \in B_{\beta^{\frac{1}{128}}}(\psi_0) \cap S^1$ we have $(l_x^{-\theta} \cup l_x^{\theta})\backslash B_{\mathcal{C}_6\beta^{\frac{1}{256}}}(x) \subset X(x_0, \psi_0, \mathcal{C}_4\beta^{\frac{1}{256}})$.

Since $X(0, \psi_0, \mathcal{C}_4\beta^{\frac{1}{256}}) = X(0, -\psi_0, \mathcal{C}_4\beta^{\frac{1}{256}})$ we can assume without loss generality that $\psi_0 \cdot v_1 > 0$. Pick $x \in G$, by the Co-area formula we must be able to find $\theta_1 \in B_{\beta^{\frac{1}{128}}}(\psi_0) \cap S^1$ such that

$$\int_{(l_x^{-\theta_1} \cup l_x^{\theta_1}) \cap \mathcal{U}} h(z) + \beta^{-1}\left|1 - |\nabla \tilde{u}(z)|^2\right|^2 dH^1 z \leq c\beta^{\frac{1}{48}}/\beta^{-\frac{1}{128}} \leq c\beta^{\frac{1}{128}}. \tag{84}$$

So let d, e be the endpoints of the connected set 1d set $(l_x^{-\theta_1} \cup l_x^{\theta_1}) \cap \mathcal{U} \cap H(\mathcal{C}_5\beta^{\frac{1}{256}}v_1, v_1)$ where we chose $d \in \partial H(\mathcal{C}_5\beta^{\frac{1}{256}}v_1, v_1)$ and $e \in \partial\mathcal{U}$, note by Step 4 $[d,e]\setminus B_{\mathcal{C}_6\beta^{\frac{1}{128}}}(x) \subset X(x_0, \psi_0, \mathcal{C}_4\beta^{\frac{1}{256}}) \cap H(\mathcal{C}_5\beta^{\frac{1}{256}}v_1, v_1)$. Now since for any $z \in [d,e]\setminus B_{\mathcal{C}_6\beta^{\frac{1}{128}}}(x)$ with $h(z) = 0$ by (81) we have $z \in \mathbb{V}_{-v_1}$ so

$$H^1\left([d,e]\setminus\mathbb{V}_{-v_1}\right) \leq 2\mathcal{C}_6\beta^{\frac{1}{128}} + H^1\left([d,e]\setminus(B_{\mathcal{C}_6\beta^{\frac{1}{128}}}(x)\cup\mathbb{V}_{-v_1})\right) \overset{(84)}{\leq} c\beta^{\frac{1}{128}}. \tag{85}$$

Note also that if $z \in \mathbb{V}_{-v_1}$ so $\nabla\tilde{u}(z) \in B_{\mathcal{C}_5\beta^{\frac{1}{256}}}(-v_1)$ and as $\theta_1 \in B_{\beta^{\frac{1}{128}}}(\psi_0) \subset B_{\mathcal{C}_4\beta^{\frac{1}{256}}}(v_1)$ thus $\nabla\tilde{u}(z)\cdot(-\theta_1) \geq 1 - c\beta^{\frac{1}{128}}$ and by the fundamental theorem of Calculus

$$\begin{aligned}
\tilde{u}(d) - \tilde{u}(e) &= \int_{[e,d]} \nabla u(z)\cdot(-\theta_1)dH^1z \\
&\geq \int_{\mathbb{V}_{-v_1}\cap[e,d]} \nabla\tilde{u}(z)\cdot(-\theta_1)dH^1z - \int_{[e,d]\setminus\mathbb{V}_{-v_1}} |\nabla\tilde{u}(z)|\,dH^1z \\
&\overset{(85)}{\geq} \left(1 - c\beta^{\frac{1}{128}}\right)H^1\left(\mathbb{V}_{-v_1}\cap[e,d]\right) - H^1\left([e,d]\setminus\mathbb{V}_{-v_1}\right) \\
&\quad -c\int_{[e,d]} \left|1 - |\nabla\tilde{u}|^2\right| dH^1 \\
&\overset{(84)}{\geq} |d-e|\,(1 - c\beta^{\frac{1}{128}}).
\end{aligned} \tag{86}$$

Since the curvature of $\partial\mathcal{U}$ is bounded above by 10 it is easy to see that

$$|e - \tilde{a}| \leq c\beta^{\frac{1}{256}}, \tag{87}$$

it is also easy to see $[e,\tilde{a}] \subset \mathcal{U}\setminus\Omega$ and $\tilde{u}$ is 1-Lipschitz on $\mathcal{U}\setminus\Omega$ so

$$|\tilde{u}(e) - \tilde{u}(\tilde{a})| \leq c\beta^{\frac{1}{256}}. \tag{88}$$

Thus we have

$$\begin{aligned}
\tilde{u}(d) &= \tilde{u}(d) - \tilde{u}(\tilde{a}) \\
&\overset{(86),(87),(88)}{\geq} |d - \tilde{a}| - c\beta^{\frac{1}{256}} \\
&\geq |\tilde{a}| - c\beta^{\frac{1}{256}} = 2^{-1}\mathrm{diam}(\mathcal{U}) - c\beta^{\frac{1}{256}}.
\end{aligned} \tag{89}$$

Pick $r_0 \in \left[|d|, |d| + \beta^{\frac{1}{256}}\right]$ such that $\int_{\partial B_{r_0}(0)} \left|1 - |\nabla\tilde{u}(z)|^2\right| dH^1z \leq c\beta^{-\frac{1}{256}}\beta$. Now fix $y \in \partial B_{r_0}(0)$, let $s = [d,e] \cap \partial B_{r_0}(0)$ and Γ_1 denote a connected component of $\partial B_{r_0}(0)\setminus\{s,y\}$. So we know $\int_{\Gamma_1\cup[d,s]} |\nabla\tilde{u}(z)|\,dH^1z \leq cH^1(\Gamma_1\cup[d,s]) \leq c\beta^{\frac{1}{256}}$ so we can apply the fundamental theorem of Calculus we have that $|u(y) - u(d)| \leq c\beta^{\frac{1}{256}}$ and since y was an arbitrary point in $\partial B_{r_0}(0)$, using (89) this gives

$$\inf\{\tilde{u}(z) : z \in \partial B_{r_0}(0)\} \geq 2^{-1}\mathrm{diam}(\mathcal{U}) - c\beta^{\frac{1}{256}}. \tag{90}$$

By definition (see (42)) $\tilde{u}(z) = u(z) + 10^{-1}$ for any $z \in \partial B_{r_0}(0)$. Since $\mathrm{diam}(\mathcal{U}) = \frac{22}{10}$ putting this with (90) we have (62). □

Proof of Theorem 2. Let $r_0 \in (\mathcal{C}_3^{-1}\beta^{\frac{1}{256}}, \mathcal{C}_3\beta^{\frac{1}{256}})$ be a number we obtain from Lemma 4 that satisfies (62). By Fubini's Theorem we know $\int_\Omega\int_\Omega \left|1 - |\nabla u(z)|^2\right|^2 |z-y|^{-1}\,dzdy \leq \mathcal{C}_7\beta^2$ for

some constant $\mathcal{C}_7 > 0$. Let

$$G_0 := \left\{ y \in \Omega : \int_\Omega \left| 1 - |\nabla u(z)|^2 \right|^2 |z-y|^{-1} \, dz \leq \beta \right\}. \tag{91}$$

Note that $|\Omega \backslash G_0| \leq \mathcal{C}_7 \beta$.

Let $a, b \in \overline{\Omega}$ be such that $|a-b| = diam(\Omega)$. Let $\vartheta = \frac{a+b}{2}$. Since $r_0 > \mathcal{C}_3^{-1} \beta^{\frac{1}{256}}$ we can pick $x_0 \in B_{\beta^{\frac{1}{4}}}(\vartheta) \cap G_0 \subset B_{r_0}(\vartheta)$. So by the Co-area formula there exists $\Psi \subset S^1$ such that $H^1(S^1 \backslash \Psi) \leq \sqrt{\beta}$ and

$$\int_{l^\theta_{x_0}} \left| 1 - |\nabla u|^2 \right|^2 dH^1 z \leq c\sqrt{\beta} \text{ for each } \theta \in \Psi. \tag{92}$$

For any $\theta \in S^1$ define $P(\theta) := l^\theta_{x_0} \cap \partial\Omega$, we will show

$$|P(\theta) - x_0| \geq 1 - c\beta^{\frac{1}{256}} \text{ for any } \theta \in \Psi. \tag{93}$$

To see this we argue as follows, for each $z \in [x, P(\theta)]$ let $\theta_z \in S^1$ be such that $|\nabla u(z) - \theta_z| = d(\nabla u(z), S^1)$. Note $d(\nabla u(z), S^1) \leq c \left| |\nabla u(z)| - 1 \right|$

$$\begin{aligned} \int_{[x_0, P(\theta)]} |\nabla u(z) - \theta_z| \, dH^1 z &\leq c \left(\int_{[x_0, P(\theta)]} \left| |\nabla u(z)|^2 - 1 \right|^2 dH^1 z \right)^{\frac{1}{2}} \\ &\overset{(92)}{\leq} c\beta^{\frac{1}{4}}. \end{aligned} \tag{94}$$

So

$$\begin{aligned} u(x_0) &= u(x_0) - u(P(\theta)) \\ &= \int_{[x_0, P(\theta)]} \nabla u(z) \cdot (-\theta) dH^1 z \\ &\overset{(94)}{\leq} \int_{[x_0, P(\theta)]} \theta_z \cdot (-\theta) dH^1 z + c\beta^{\frac{1}{4}} \\ &\leq |x_0 - P(\theta)| + c\beta^{\frac{1}{4}}. \end{aligned} \tag{95}$$

Let $y_\theta := [x_0, P(\theta)] \cap \partial B_{r_0}(\vartheta)$. In exactly the same way we have

$$|u(y_\theta) - u(x_0)| \leq c\beta^{\frac{1}{256}}. \tag{96}$$

So

$$u(x_0) \geq u(y_\theta) - |u(y_\theta) - u(x_0)| \overset{(96)}{\geq} u(y_\theta) - c\beta^{\frac{1}{256}} \overset{(62)}{\geq} 1 - c\beta^{\frac{1}{256}} \tag{97}$$

this together with (95) establishes (93).

Let $N = \left[2^{-1} \beta^{-\frac{1}{2}} \right]$, we can divide S^1 into N disjoint pieces of equal length, denote them $I_1, I_2, \ldots I_N$. Formally; $\bigcup_{k=1}^N I_k = S^1$ and $H^1(I_k) = \frac{2\pi}{N}$ for each $k = 1, 2, \ldots N$. We can pick $\theta_k \in I_k \cap \Psi$ for each $k = 1, 2, \ldots N$.

Let

$$h = \min \left\{ |P(\theta_k) - x_0| : k \in \{1, 2, \ldots N\} \right\}. \tag{98}$$

We define Π to be the convex hull of the points $x_0 + h\theta_1, x_0 + h\theta_2, \ldots x_0 + h\theta_N$. Now by the construction of Π, for any $y \in \partial\Pi$ we can find $k \in \{1, 2, \ldots N\}$ such that $|y - (x_0 + h\theta_k)| \leq c\sqrt{\beta}$ and thus $|y - x_0| \geq h - c\sqrt{\beta}$ and so

$$B_{h - c\sqrt{\beta}}(x_0) \subset \Pi. \tag{99}$$

Note that by using (93) we know $h > 1 - c\beta^{\frac{1}{256}}$ and since $|x_0 - \vartheta| \leq \beta^{\frac{1}{4}}$ (recalling also that Ω is convex and so $\Pi \subset \Omega$) there exists positive constant $\mathcal{C}_8$ such that

$$B_{1-\mathcal{C}_8\beta^{\frac{1}{256}}}(\vartheta) \subset \Omega. \tag{100}$$

We claim

$$\Omega \subset B_{1+2\mathcal{C}_8\beta^{\frac{1}{256}}}(\vartheta). \tag{101}$$

Suppose not, so there exists $y \in \partial\Omega$ such that $|y - \vartheta| \geq 1 + 2\mathcal{C}_8\beta^{\frac{1}{256}}$. By inequality (100) we know $-\frac{y-\vartheta}{|y-\vartheta|}\left(1 - \mathcal{C}_8\beta^{\frac{1}{256}}\right) + \vartheta \subset \Omega$ and as by convexity of Ω, $\left[y, \vartheta - \frac{y-\vartheta}{|y-\vartheta|}\left(1 - \mathcal{C}_8\beta^{\frac{1}{256}}\right)\right] \subset \Omega$ thus

$$H^1\left(\left[y, \vartheta - \frac{y-\vartheta}{|y-\vartheta|}\left(1 - \mathcal{C}_8\beta^{\frac{1}{256}}\right)\right]\right) \geq 2 + \mathcal{C}_8\beta^{\frac{1}{256}}$$

which contradicts the fact $\operatorname{diam}(\Omega) = 2$ hence (101) is established. Since the center of mass of Ω is 0, i.e. $\int_\Omega dx = 0$, by (100), (101) we have that $|\vartheta| \leq c\beta^{\frac{1}{256}}$. Now $|x_0 - P(\theta)| \leq |P(\theta)| + |x_0| \overset{(101)}{\leq} 1 + c\beta^{\frac{1}{256}}$ so putting this together with (97) we have

$$u(x_0) - u(P(\theta)) = u(x_0) \geq |x_0 - P(\theta)| - c\beta^{\frac{1}{256}}. \tag{102}$$

Thus

$$\begin{aligned}
\int_{[x_0,P(\theta)]} |\nabla u(z) + \theta|^2 \, dH^1 z \quad &= \quad \int_{[x_0,P(\theta)]} \left(|\nabla u(z)|^2 + 2\nabla u(z)\cdot\theta + 1\right) dH^1 z \\
&\overset{(92)}{\leq} \quad 2(1 + c\beta^{\frac{1}{4}})\,|x_0 - P(\theta)| + 2\left(u(P(\theta)) - u(x_0)\right) \\
&\overset{(102)}{\leq} \quad c\beta^{\frac{1}{256}} \text{ for any } \theta \in \Psi.
\end{aligned} \tag{103}$$

Now using the elementary fact that $\left|\nabla u(z) + \frac{z-x_0}{|z-x_0|}\right|^2 \leq \left||\nabla u(z)|^2 - 1\right|^2 + c$, since $x_0 \in G_0$ we have

$$\begin{aligned}
&\int_{\theta\in S^1\setminus\Psi} \int_{l^\theta_{x_0}} \left|\nabla u(z) + \frac{z-x_0}{|z-x_0|}\right|^2 dH^1 z dH^1\theta \\
&\qquad \leq cH^1(S^1\setminus\Psi) + \int_{\theta\in S^1} \int_{l^\theta_{x_0}} \left||\nabla u(z)|^2 - 1\right|^2 dH^1 z dH^1\theta \\
&\qquad \overset{(92)}{\leq} c\sqrt{\beta}.
\end{aligned} \tag{104}$$

And thus

$$\begin{aligned}
\int_\Omega \left|\nabla u(z) + \frac{z-x_0}{|z-x_0|}\right|^2 dz \quad &\leq \quad \int_\Omega \left|\nabla u(z) + \frac{z-x_0}{|z-x_0|}\right|^2 |z-x_0|^{-1}\, dz \\
&\leq \quad \int_{\theta\in S^1} \int_{l^\theta_{x_0}} \left|\nabla u(z) + \frac{z-x_0}{|z-x_0|}\right|^2 dH^1 z dH^1\theta \\
&\overset{(104),(103)}{\leq} \quad c\beta^{\frac{1}{256}}.
\end{aligned}$$

By Holder's inequality this gives

$$\left(\int_\Omega \left|\nabla u(z) + \frac{z-x_0}{|z-x_0|}\right|^2 dz\right)^{\frac{1}{2}} \leq c\beta^{\frac{1}{512}}. \tag{105}$$

Now for any $z \in \Omega \backslash B_{\beta^{\frac{1}{512}}}(0)$, since $|x_0| \leq c\beta^{\frac{1}{256}}$

$$\begin{aligned}
\left| \frac{z}{|z|} - \frac{z - x_0}{|z - x_0|} \right| &= \left| \frac{z\,|z - x_0| - (z - x_0)\,|z|}{|z|\,|z - x_0|} \right| \\
&= \left| \frac{z(|z - x_0| - |z|) + x_0\,|z|}{|z|\,|z - x_0|} \right| \\
&\leq \left| \frac{|z - x_0| - |z|}{|z - x_0|} \right| + \frac{|x_0|}{|z - x_0|} \\
&\leq c\beta^{\frac{1}{512}}. \qquad (106)
\end{aligned}$$

So

$$\left(\int_\Omega \left| \frac{z}{|z|} - \frac{z - x_0}{|z - x_0|} \right|^2 dz \right)^{\frac{1}{2}} \leq c\beta^{\frac{1}{256}} + \left(\int_{\Omega \backslash B_{\beta^{\frac{1}{512}}}} \left| \frac{z}{|z|} - \frac{z - x_0}{|z - x_0|} \right|^2 dz \right)^{\frac{1}{2}} \overset{(106)}{\leq} c\beta^{\frac{1}{512}}.$$

Putting this together with (105) we have (8). □

4. Construction of upper bound for nearly circular domains

In this section we will show that given a convex domain Ω with C^2 boundary with curvature bounded above by $\epsilon^{-\frac{1}{2}}$ and that satisfies $|B_1(0) \triangle \Omega| \leq \beta$ we will construct a function u with $I_\epsilon(u) \leq \beta^{\frac{3}{16}}$, this is the contents of Proposition 1 below. The proof of Corollary 1 will follows easily from this.

Proposition 1. *Let Ω be a convex body with C^2 boundary and with curvature bounded above by $\epsilon^{-\frac{1}{2}}$ and $|\Omega \triangle B_1(0)| \leq \beta$. Let $\epsilon \in (0, \frac{\beta^{\frac{1}{2}}}{4}]$, there exists a function C^∞ function $\xi : \Omega \to \mathbb{R}$ which satisfies $\nabla u(z) \cdot \eta_z = 1$ (where η_z is the inward pointing unit normal to $\partial\Omega$ at z) and for which*

$$\int_\Omega \epsilon^{-1} \left| 1 - |\nabla \xi|^2 \right|^2 + \epsilon \left| \nabla^2 \xi \right|^2 dz \leq c\beta^{\frac{3}{32}}. \qquad (107)$$

4.1. Proof of Proposition 1.

We begin with a preliminary lemma

Lemma 5. *Let $\phi : \mathbb{R}_+ \to \mathbb{R}_+$ be a continuous function. Let ρ denote the standard convolution kernel, i.e. $\int \rho = 1$ and $\mathrm{Spt}\rho \subset B_1(0)$ and define $\rho_h(z) := h^{-2}\rho(h^{-1}z)$.*

Suppose $f : \mathbb{R}^n \to \mathbb{R}$ be an affine function with $\eta = \nabla f$, let $g(x) = f * \rho_{\phi(x)}(x)$ then

$$g(x) = f(x) \text{ for all } x \in \mathbb{R}^n. \qquad (108)$$

Proof. So

$$\begin{aligned}
g(x) &= \int f(x - y)(\phi(x))^{-2} \rho(\phi(x)^{-1} y) dy \\
&= \int (f(x) + \eta \cdot (x - y))(\phi(x))^{-2} \rho(\phi(x)^{-1} y) dy \\
&= f(x) + \int \eta \cdot (x - y)(\phi(x))^{-2} \rho(\phi(x)^{-1} y) dy \\
&= f(x) + \int_{[-\phi(x) + x \cdot \eta, \phi(x) + x \cdot \eta]} \int_{\lambda\eta + \eta^\perp} (x \cdot \eta - \lambda)(\phi(x))^{-2} \rho(\phi(x)^{-1} z) dH^{n-2} z d\lambda \\
&= f(x) + \int_{[-\phi(x), 0]} \int_{(x \cdot \eta + \lambda)\eta + \eta^\perp} -\lambda(\phi(x))^{-2} \rho(\phi(x)^{-1} z) dH^{n-2} z d\lambda \\
&\qquad + \int_{[0, \phi(x)]} \int_{(x \cdot \eta + \lambda)\eta + \eta^\perp} -\lambda(\phi(x))^{-2} \rho(\phi(x)^{-1} z) dH^{n-2} z d\lambda \qquad (109)
\end{aligned}$$

Since for any $\lambda \in [0, \phi(x)]$ we have

$$\int_{(x\cdot\eta-\lambda)\eta+\eta^{\perp}} \lambda(\phi(x))^{-2}\rho(\phi(x)^{-1}z)dH^{n-2}z = \int_{(x\cdot\eta+\lambda)\eta+\eta^{\perp}} \lambda(\phi(x))^{-2}\rho(\phi(x)^{-1}z)dH^{n-2}z$$

thus the last two term of (109) cancel and so $g(x) = f(x)$. This completes the proof of the lemma. □

Lemma 6. *Suppose Ω is a convex and $|\Omega \triangle B_1| = \beta$. Let $a_\theta = \partial\Omega \cap l_0^\theta$ we have*

$$||a_\theta| - 1| \leq c\sqrt{\beta} \text{ and so } \partial\Omega \subset N_{c\sqrt{\beta}}(\partial B_1(0)). \tag{110}$$

In addition for any θ there exists constant c such that

$$|\eta_{a_\theta} + \theta| \leq c\beta^{\frac{1}{4}}. \tag{111}$$

Proof of Lemma.

Step 1. We will show $B_{\frac{1}{2}}(0) \subset \Omega$.

Proof of Step 1. Suppose not, so we can pick $x \in \partial\Omega \cap B_{\frac{1}{2}}(0)$. Let η_x be an inward pointing unit normal to $\partial\Omega$ at x, by convexity of Ω we have $\Omega \subset \overline{H(x, \eta_x)}$ and so $B_1(0) \cap H(x, -\eta_x) \cap \Omega = \emptyset$ which implies $|B_1(0)\backslash\Omega| \geq |B_1(0) \cap H(x, -\eta_x)| > \frac{1}{8}$ which contradicts that $|\Omega \triangle B_1| \leq \beta$.

Step 2. $a_\theta \in B_{1+c\sqrt{\beta}}(0)$.

Proof of Step 2. Suppose not. Since Ω is convex we have $\text{conv}\left(\{a_\theta\} \cup B_{\frac{1}{2}}(0)\right) \subset \Omega$ and

$$\left|\text{conv}\left(\{a_\theta\} \cup B_{\frac{1}{2}}(0)\right) \backslash B_1(0)\right| > c\beta,$$

thus we have $|\Omega\backslash B_1(0)| > c\beta$ which contradicts the fact that $|\Omega \triangle B_1(0)| = \beta$.

Step 3. We will show $a_\theta \notin B_{1-c\sqrt{\beta}}(0)$.

Proof of Step 3. Suppose $a_\theta \in B_{1-c\sqrt{\beta}}(0)$ this implies $|B_1(0)\backslash H(a_\theta, \eta_{a_\theta})| \geq c\beta$ and $\Omega \subset H(a_\theta, \eta_{a_\theta})$ so $|B_1(0)\backslash\Omega| \geq c\beta$ which gives a contradiction.

Proof of Lemma completed. Suppose (111) is false, since $|a_\theta - \theta| \leq c\sqrt{\beta}$ we have

$$|B_1(0)\backslash H(a_\theta, \eta_{a_\theta})| \geq c\beta^{\frac{3}{4}},$$

as before this implies $|B_1(0)\backslash\Omega| > c\beta^{\frac{3}{4}}$ which is a contradiction. □

Lemma 7. *Let Ω be convex and define $u(x) := d(z, \partial\Omega)$ for any $z \in \Omega$ then function u is concave*

Proof of Lemma. Let $a, b \in \Omega$. Since Ω is convex $\text{conv}\left(B_{u(a)}(a) \cup B_{u(b)}(b)\right) \subset \Omega$. Now suppose there exists $\lambda \in (0, 1)$ such that

$$u\left(\lambda a + (1-\lambda)b\right) < \lambda u(a) + (1-\lambda)u\left(b\right)$$

then as this implies $B_{u(\lambda a+(1-\lambda)b)}\left(\lambda a + (1-\lambda)\, b\right) \subset \text{int}\left(\text{conv}\left(B_{u(a)}(a) \cup B_{u(b)}(b)\right)\right)$ we must be able to find $x \in \partial\Omega$ with $x \in \partial\Omega \cap \text{conv}\left(B_{u(a)}(a) \cup B_{u(b)}(b)\right)$ which is a contradiction. □

Lemma 8. *Let $\epsilon > 0$, suppose Ω is a convex body with C^2 boundary and with curvature bounded above by $\epsilon^{-\frac{1}{2}}$. We will construct a function $\psi : \Omega \cap N_\epsilon(\partial\Omega) \to \mathbb{R}$ with the following properties*

$$\int_{\Omega\cap N_\epsilon(\partial\Omega)} \left|1 - |\nabla\psi|^2\right|^2 \leq c\epsilon^2, \tag{112}$$

$$\int_{\Omega\cap N_\epsilon(\partial\Omega)} \left|\nabla^2\psi\right|^2 \leq c, \tag{113}$$

$$\psi(z) = \left[u * \rho_\epsilon\right](z) \text{ for any } z \in \Omega\backslash N_\epsilon(\partial\Omega) \tag{114}$$

and

$$\nabla\psi(z) = \eta_z \text{ for each } z \in \partial\Omega. \tag{115}$$

Proof. Let $w : \mathbb{R}_+ \to \mathbb{R}_+$ be a smooth monotonic function with the following properties

$$w(z) = \begin{cases} z & \text{for } z \in \left[0, \frac{\epsilon}{3}\right) \\ \epsilon & \text{for } z \geq \epsilon \end{cases} \tag{116}$$

and $\sup |\ddot{w}| \leq c\epsilon^{-1}$.

Let $u(x) = d(x, \partial\Omega)$. For any $x \in \Omega \cap N_\epsilon(\partial\Omega)$ define $\phi(x) = w(u(x))$. Let ρ be the standard convolution kernel, i.e. as defined in Lemma 5. We will convolve the function u with convolution kernel $\rho_{\phi(x)}(z) := \rho\left(\frac{z}{\phi(x)}\right) / \left(\phi(x)\right)^2$. Since the convulsion kernel varies with x, when we differentiate $u * \rho_{\phi(x)}$, the derivative will involve a term with the derivative of $\rho_{\phi(x)}$. For this reason we need to calculate various partial derivatives of $\rho_{\phi(x)}$.

For each $x \in \Omega \cap N_\epsilon(\partial\Omega)$ let $b_x \in \partial\Omega$ be defined by $|x - b_x| = u(x)$. Note that since the curvature of $\partial\Omega$ is bounded above by $\epsilon^{-\frac{1}{2}}$, for any $x \in \Omega \cap N_\epsilon(\partial\Omega)$ we have that there is one unique $b_x \in \partial\Omega$ such that $|x - b_x| = u(x)$. We define $\varsigma_x = \frac{x - b_x}{|x - b_x|}$, let $R = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$ and define $\omega_x = R\varsigma_x$.

Note $\varsigma_x = \eta_{b_x}$, i.e. the inward pointing unit normal to $\partial\Omega$ at b_x. Note also that for all small enough h, $b_x = b_{x+h\varsigma_x}$ so $u(x + h\varsigma_x) = h + u(x)$. Thus

$$\begin{aligned} \phi_{,\varsigma_x}(x) &= \lim_{h\to 0} \frac{\phi(x + h\varsigma_x) - \phi(x)}{h} \\ &= \lim_{h\to 0} \frac{w(u(x) + h) - w(u(x))}{h} \\ &= \dot{w}(u(x)). \end{aligned}$$

Note also that since $|\nabla u(x)| = 1$ and $u_{,\varsigma_x}(x) = \lim_{h\to 0} \frac{u(x+h\varsigma_x) - u(x)}{h} = 1$ so

$$u_{,\omega_x}(x) = \lim_{h\to 0} \frac{u(x + h\omega_x) - u(x)}{h} = 0.$$

Thus

$$\phi_{,\omega_x}(x) = \dot{w}(u(x))u_{,\omega_x}(x) = 0. \tag{117}$$

So

$$\begin{aligned} \frac{\partial}{\partial\varsigma_x}\left(\rho_{\phi(x)}(z)\right) &= \frac{\partial}{\partial\varsigma_x}\left(\rho\left(\frac{z}{\phi(x)}\right)\left(\phi(x)\right)^{-2}\right) \\ &= -\nabla\rho\left(\frac{z}{\phi(x)}\right) \cdot z\frac{\phi_{,\varsigma_x}(x)}{(\phi(x))^4} - 2\rho\left(\frac{z}{\phi(x)}\right)\frac{\phi_{,\varsigma_x}(x)}{(\phi(x))^3} \end{aligned} \tag{118}$$

and

$$\frac{\partial}{\partial\omega_x}\left(\rho_{\phi(x)}(z)\right) = 0. \tag{119}$$

Define $\psi(x) := \int u(x - z)\rho_{\phi(x)}(z)dz$. Now

$$\begin{aligned} \psi_{,\varsigma_x}(x) \overset{(118)}{=} & \int u_{,\varsigma_x}(x - z)\rho_{\phi(x)}(z)dz \\ & - \int u(x - z)\left(\nabla\rho\left(\frac{z}{\phi(x)}\right) \cdot z\frac{\phi_{,\varsigma_x}(x)}{(\phi(x))^4} + 2\rho\left(\frac{z}{\phi(x)}\right)\frac{\phi_{,\varsigma_x}(x)}{(\phi(x))^3}\right)dz \end{aligned} \tag{120}$$

In the same way it is easy to see $\psi_{,\omega_x}(x) = 0$ and so

$$\psi_{,\varsigma_x\omega_x}(x) = 0. \tag{121}$$

We also know that $u_{,\varsigma_x\varsigma_x}(x)=0$ so

$$\begin{aligned}
&\psi_{,\varsigma_x\varsigma_x}(x)\\
&=\int u(x-z)\partial_{\varsigma_x}\left(\sum_{k=1}^{2}-\rho_{,k}\left(\frac{z}{\phi(x)}\right)\frac{z_k\phi_{,\varsigma_x}(x)}{(\phi(x))^4}-2\rho\left(\frac{z}{\phi(x)}\right)\frac{\phi_{,\varsigma_x}(x)}{(\phi(x))^3}\right)dz\\
&=\int u(x-z)\left(\sum_{k,l=1}^{2}\rho_{,kl}\left(\frac{z}{\phi(x)}\right)\frac{(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^6}z_kz_l-\sum_{k=1}^{2}\rho_{,k}\left(\frac{z}{\phi(x)}\right)z_k\partial_{\varsigma_x}\left(\frac{\phi_{,\varsigma_x}(x)}{(\phi(x))^4}\right)\right.\\
&\qquad\left.+2\sum_{m=1}^{2}\rho_{,m}\left(\frac{z}{\phi(x)}\right)z_m\frac{(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^4}-2\rho\left(\frac{z}{\phi(x)}\right)\partial_{\varsigma_x}\left(\frac{\phi_{,\varsigma_x}(x)}{(\phi(x))^3}\right)\right)dz
\end{aligned}$$

Note

$$\partial_{\varsigma_x}\left(\frac{\phi_{,\varsigma_x}(x)}{(\phi(x))^3}\right)=\frac{-3(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^4}+\frac{\phi_{,\varsigma_x\varsigma_x}(x)}{(\phi(x))^3}$$

and

$$\partial_{\varsigma_x}\left(\frac{\phi_{,\varsigma_x}(x)}{(\phi(x))^4}\right)=\frac{-4(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^5}+\frac{\phi_{,\varsigma_x\varsigma_x}(x)}{(\phi(x))^4}. \tag{122}$$

So

$$\begin{aligned}
\psi_{,\varsigma_x\varsigma_x}(x) \;=\; &\int u(x-z)\left(\left(\nabla^2\rho\left(\frac{z}{\phi(x)}\right):z\otimes z\right)\frac{(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^6}\right.\\
&+\left(-\frac{\phi_{,\varsigma_x\varsigma_x}(x)}{(\phi(x))^4}+\frac{4(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^5}+\frac{2(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^4}\right)\nabla\rho\left(\frac{z}{\phi(x)}\right)\cdot z\\
&\left.+\left(\frac{6(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^4}-\frac{2\phi_{,\varsigma_x\varsigma_x}(x)}{(\phi(x))^3}\right)\rho\left(\frac{z}{\phi(x)}\right)\right)dz.
\end{aligned} \tag{123}$$

Step 1. For any $x\in N_\epsilon(\partial\Omega)\cap\Omega$ we have

$$\sup\left\{|\nabla u(z)-\varsigma_x|:z\in B_{4u(x)}(x)\cap\Omega\right\}\leq c\epsilon^{-\frac{1}{2}}u(x). \tag{124}$$

Proof of Step 1. Since $\partial\Omega$ has curvature less than $\epsilon^{-\frac{1}{2}}$ for any $x_1,x_2\in\partial\Omega$, $\left[x_1,x_1+\epsilon^{\frac{1}{2}}\eta_{x_1}\right]\cap\left[x_2,x_2+\epsilon^{\frac{1}{2}}\eta_{x_2}\right]=\emptyset$. So for any $x_1,x_2\in B_{4u(x)}(x)\cap\partial\Omega$, $|\eta_{x_1}-\eta_{x_2}|\leq\epsilon^{-\frac{1}{2}}H^1(B_{4u(x)}(x)\cap\partial\Omega)$. Note as $\Omega\cap B_{4u(x)}(x)$ is convex and $\partial\Omega\cap B_{4u(x)}(x)\subset\partial(\Omega\cap B_{4u(x)}(x))$ so $H^1(\partial\Omega\cap B_{4u(x)}(x))\leq cu(x)$. Hence $|\eta_{x_1}-\eta_{x_2}|\leq c\epsilon^{-\frac{1}{2}}u(x)\leq c\sqrt{\epsilon}$ so it is clear that

$$B_{4u(x)}(x)\cap\Omega\subset\bigcup_{z\in\partial\Omega\cap B_{4u(x)}(x)}\left[z,z+\sqrt{\epsilon}\eta_z\right]. \tag{125}$$

For any $z\in B_{4u(x)}(x)\cap\Omega$ we have $\nabla u(z)=\frac{z-b_z}{|z-b_z|}=\eta_{b_z}$ where b_z is such that $|z-b_z|=d(z,\partial\Omega)$. So for any $z_1,z_2\in B_{4u(x)}(x)\cap\Omega$ by (125) we have that $b_{z_1},b_{z_2}\in\partial\Omega\cap B_{4u(x)}(x)$, so $|\nabla u(z_1)-\nabla u(z_2)|=\left|\eta_{b_{z_1}}-\eta_{b_{z_2}}\right|\leq c\epsilon^{-\frac{1}{2}}u(x)$.

Step 2. For any $x\in N_\epsilon(\partial\Omega)\cap\Omega$ we have

$$||\nabla\psi(x)|-1|\leq c\sqrt{\epsilon}. \tag{126}$$

And

$$\lim_{y\to z}\nabla\psi(y)=\eta_z. \tag{127}$$

Proof of Step 2. From (120) we have

$$|\psi_{,\varsigma_x}(x)-1| \leq \overbrace{\left|\int (u_{,\varsigma_x}(x-z)-1)\rho\left(\frac{z}{\phi(x)}\right)(\phi(x))^{-2}\,dz\right|}^{B} + \overbrace{\left|\int \frac{-u(x-z)\phi_{,\varsigma_x}(x)}{(\phi(x))^3}\left(\nabla\rho\left(\frac{z}{\phi(x)}\right)\cdot\frac{z}{\phi(x)}+2\rho\left(\frac{z}{\phi(x}\right)\right)dz\right|}^{C}. \tag{128}$$

Now for any $z\in \mathrm{Spt}\rho_{\phi(x)}$ we have that $\nabla u(x-z)=u_{,\varsigma_x}(x-z)\varsigma_x+u_{,\omega_x}(x-z)\omega_x$ now since $\mathrm{Spt}\rho_{\phi(x)}\subset B_{\phi(x)}(0)\subset B_{u(x)}(0)$ so for any $z\in\mathrm{Spt}\rho_{\phi(x)}$ by (124) from Step 1 we have $|\nabla u(x-z)-\varsigma_x|\leq c\epsilon^{-\frac{1}{2}}u(x)$ and thus

$$|u_{,\varsigma_x}(x-z)-1|\leq c\epsilon^{-\frac{1}{2}}u(x) \tag{129}$$

so (noting $u(x)\leq c\phi(x)$ for any $x\in N_\epsilon(\partial\Omega)\cap\Omega$)

$$B\leq cu(x)\epsilon^{-\frac{1}{2}}<c\phi(x)\epsilon^{-\frac{1}{2}}. \tag{130}$$

Also defining $w=⨍_{B_{\phi(x)}(x)}\nabla u$

$$|w-\varsigma_x|=\left|⨍_{B_{\phi(x)}(x)}(\nabla u(z)-\varsigma_x)\,dz\right|\overset{(124)}{\leq} c\epsilon^{-\frac{1}{2}}\phi(x). \tag{131}$$

So by Poincare inequality there exists affine function l_w with $\nabla l_w=w$

$$\begin{aligned}⨍_{B_{\phi(x)}(x)}|u(z)-l_w(z)|\,dz &\leq c\phi(x)⨍_{B_{\phi(x)}(x)}|\nabla u(z)-w|\,dz\\ &\leq c\phi(x)\left(⨍_{B_{\phi(x)}(x)}|\nabla u(z)-\varsigma_x|\,dz+c|w-\varsigma_x|\right)\\ &\overset{(124),(131)}{\leq} c\epsilon^{-\frac{1}{2}}(\phi(x))^2.\end{aligned} \tag{132}$$

Now using (131), again for the appropriate choice of affine function l_{ς_x} with $\nabla l_{\varsigma_x}=\varsigma_x$ we have by Poincare's inequality

$$⨍_{B_{\phi(x)}(x)}|l_{\varsigma_x}(z)-l_w(z)|\,dz\leq c\phi(x)⨍_{B_{\phi(x)}}|w-\varsigma_x|\,dz\overset{(131)}{\leq}c\epsilon^{-\frac{1}{2}}(\phi(x))^2$$

with (132) gives

$$⨍_{B_{\phi(x)}(x)}|l_{\varsigma_x}(z)-u(z)|\,dz\leq c\epsilon^{-\frac{1}{2}}(\phi(x))^2. \tag{133}$$

Let g be defined by $g(x)=l_{\varsigma_x}*\rho_{\rho(x)}(x)$, note by Lemma 5 we have $\nabla g(z)=\varsigma_x$ for any $z\in\mathbb{R}^2$ and hence $g_{,\varsigma_x}(x)=1$ and as

$$\begin{aligned}g_{\varsigma_x}(x) &= \int\rho\left(\frac{z}{\phi(x)}\right)(\phi(x))^{-2}\,dz\\ &\quad-\int\frac{l_{\varsigma_x}(x-z)}{(\phi(x))^3}\phi_{,\varsigma_x}(x)\left(\nabla\rho\left(\frac{z}{\phi(x)}\right)\cdot z(\phi(x))^{-1}+2\rho\left(\frac{z}{\phi(x)}\right)\right)dz\\ &= 1-\int\frac{l_{\varsigma_x}(x-z)}{(\phi(x))^3}\phi_{,\varsigma_x}(x)\left(\nabla\rho\left(\frac{z}{\phi(x)}\right)\cdot z(\phi(x))^{-1}+2\rho\left(\frac{z}{\phi(x)}\right)\right)dz.\end{aligned}$$

Thus

$$0 = \int \frac{l_{\varsigma_x}(x-z)}{(\phi(x))^3}\phi_{,\varsigma_x}(x)\left(\nabla\rho\left(\frac{z}{\phi(x)}\right)\cdot z\,(\phi(x))^{-1}+2\rho\left(\frac{z}{\phi(x)}\right)\right)dz \tag{134}$$

So

$$\begin{aligned} C &\leq \int \frac{|l_{\varsigma_x}(x-z)-u(x-z)|}{(\phi(x))^3}\left|\phi_{,\varsigma_x}(x)\left(\nabla\rho\left(\frac{z}{\phi(x)}\right)\cdot z\,(\phi(x))^{-1}+2\rho\left(\frac{z}{\phi(x)}\right)\right)\right|dz \\ &\leq c(\phi(x))^{-3}\int_{B_{\phi(x)}(x)}|l_{\varsigma_x}(z)-u(z)|\,dz \\ &\overset{(133)}{\leq} c\epsilon^{-\frac{1}{2}}\phi(x). \end{aligned} \tag{135}$$

Since $x\in N_\epsilon(\partial\Omega)\cap\Omega$ we know $\phi(x)\leq c\epsilon$ applying (135) and (130) to (128) gives

$$|\psi_{,\varsigma_x}(x)-1|\leq c\epsilon^{-\frac{1}{2}}\phi(x)\leq c\sqrt{\epsilon}. \tag{136}$$

As $\psi_{,\omega_x}(x)=0$, so $|\nabla\psi(x)-\varsigma_x|\leq c\sqrt{\epsilon}$ and (126) follows easily. Also for (136) we know $|\nabla\psi(x)-\eta_{b_x}|\leq c\epsilon^{-\frac{1}{2}}u(x)$ and (127) follows. This completes the proof of Step 2.

Step 3. For any $x\in N_\epsilon(\partial\Omega)\cap\Omega$ we have $\left|\nabla^2\psi(x)\right|\leq c\epsilon^{-\frac{1}{2}}$.

Proof Step 3. From Step 2 (133) we know the existence of an affine function l_{ς_x} with $\nabla l_{\varsigma_x}=\varsigma_x$ with $\fint_{B_{\phi(x)}(x)}|u-l_{\varsigma_x}|\,dz\leq c\epsilon^{\frac{1}{2}}\phi(x)^2$.

Let $g(x):=l_{\varsigma_x}*\rho_{\phi(x)}(x)$ so by Lemma 5 we know $g_{,\varsigma_x\varsigma_x}(x)=0$. By following through the same calculation that gave (123) we have

$$\begin{aligned} 0 = \int l_{\varsigma_x}(x-z)\Bigg(&\left(\nabla^2\rho\left(\frac{z}{\phi(x)}\right):z\otimes z\right)\frac{(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^6} \\ &+\left(-\frac{\phi_{,\varsigma_x\varsigma_x}(x)}{(\phi(x))^4}+\frac{4(\phi_{,\varsigma_x}(x))^4}{(\phi(x))^5}+\frac{2(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^4}\right)\nabla\rho\left(\frac{z}{\phi(x)}\right)\cdot z \\ &+\left(\frac{6(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^4}-\frac{2\phi_{,\varsigma_x\varsigma_x}(x)}{(\phi(x))^3}\right)\rho\left(\frac{z}{\phi(x)}\right)\Bigg)dz. \end{aligned} \tag{137}$$

So applying this to (123)

$$\begin{aligned} &|\psi_{,\varsigma_x\varsigma_x}(x)| \\ &\leq \int|u(x-z)-l_{\varsigma_x}(x-z)|\Bigg|\left(\nabla^2\rho\left(\frac{z}{\phi(x)}\right):z\otimes z\right)\frac{(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^6} \\ &\quad+\left(\frac{-\phi_{,\varsigma_x\varsigma_x}(x)}{(\phi(x))^4}+\frac{4(\phi_{,\varsigma_x}(x))^4}{(\phi(x))^5}+\frac{2(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^4}\right)\nabla\rho\left(\frac{z}{\phi(x)}\right)\cdot z \\ &\quad+\left(\frac{6(\phi_{,\varsigma_x}(x))^2}{(\phi(x))^4}-\frac{2\phi_{,\varsigma_x\varsigma_x}(x)}{(\phi(x))^3}\right)\rho\left(\frac{z}{\phi(x)}\right)\Bigg|dz \\ &\leq c\int_{B_{\phi(x)}(0)}\frac{|u(x-z)-l_{\varsigma_x}(x-z)|}{(\phi(x))^4}dz\left(\|\nabla^2\rho\|_\infty+\|\nabla\rho\|_\infty+\|\rho\|_\infty\right) \\ &\leq c\int_{B_{\phi(x)}(x)}|u(z)-l_{\varsigma_x}(z)|\,(\phi(x))^{-4}\,dz \\ &\overset{(133)}{\leq} c\epsilon^{-\frac{1}{2}}. \end{aligned} \tag{138}$$

Proof of Lemma completed. From Step 2, (126), for any $x \in N_\epsilon(\partial\Omega) \cap \Omega$ we have

$$\left||\nabla\psi(x)|^2 - 1\right|^2 \leq c\epsilon$$

so (112) follows. In the same way from Step 3, (113) follows.

Since for any $x \in \Omega \backslash N_\epsilon(\partial\Omega)$ we know $u(x) \geq \epsilon$ and so $\phi(x) = w(u(x)) = \epsilon$ and thus $\rho_{\phi(x)}(z) = \rho\left(\frac{z}{\epsilon}\right)\epsilon^{-1}$ and there for $\psi(x) = \int u(x-z)\rho_\epsilon(z)dz$. Thus (114) is established. □

Lemma 9. *Let $\beta > 0$, suppose Ω is a convex set with $|\Omega \triangle B_1(0)| \leq \beta$. Let $u(z) = d(z, \partial\Omega)$. For any $x \in \Omega \backslash B_{\beta^{\frac{1}{8}}}(0)$ for which the approximate derivative ∇u exists*

$$\left|\nabla u(x) + \frac{x}{|x|}\right| \leq c\beta^{\frac{3}{16}}. \tag{139}$$

Proof. For any $x \in \Omega \backslash B_{\beta^{\frac{1}{8}}}(0)$ let $b_x \in \partial\Omega$ be such that $|b_x - x| = u(x)$. Recall $a_{\frac{x}{|x|}} = \partial\Omega \cap l_0^{\frac{x}{|x|}}$, we begin by showing

$$\left|b_x - \frac{x}{|x|}\right| \leq c\beta^{\frac{3}{16}}. \tag{140}$$

Using (110) from Lemma 6

$$|x - b_x| \leq \left|x - a_{\frac{x}{|x|}}\right| \overset{(110)}{\leq} 1 - |x| + c\sqrt{\beta}. \tag{141}$$

Hence

$$|x - b_x|^2 = |x|^2 - 2x \cdot b_x + |b_x|^2 \overset{(141)}{\leq} 1 - 2|x| + |x|^2 + c\sqrt{\beta}. \tag{142}$$

Therefor

$$\begin{aligned} -2x \cdot b_x &\overset{(142)}{\leq} 1 - 2|x| + c\sqrt{\beta} - |b_x|^2 \\ &\overset{(110)}{\leq} -2|x| + c\sqrt{\beta}. \end{aligned}$$

Thus $2|x| \leq 2x \cdot b_x + c\sqrt{\beta}$. Since $|x| > \beta^{\frac{1}{8}}$ we have

$$1 \leq \frac{x}{|x|} \cdot b_x + c\frac{\sqrt{\beta}}{|x|} \leq 1 + c\beta^{\frac{3}{8}}. \tag{143}$$

Hence

$$\left|b_x - \frac{x}{|x|}\right|^2 = |b_x|^2 + 1 - 2\frac{x}{|x|} \cdot b_x \overset{(143),(110)}{\leq} c\beta^{\frac{3}{8}}$$

which gives

$$\left|\frac{x}{|x|} - b_x\right| \leq c\beta^{\frac{3}{16}}. \tag{144}$$

Let $\theta_x = \frac{b_x}{|b_x|}$ so using Lemma 6 $\left|\eta_{b_x} + \frac{b_x}{|b_x|}\right| = \left|\eta_{a_{\theta_x}} + \theta_x\right| \overset{(111)}{\leq} c\beta^{\frac{1}{4}}$ and by (110) this easily implies

$$|\eta_{b_x} + b_x| \leq c\beta^{\frac{1}{4}}. \tag{145}$$

Now since $\nabla u(x) = \frac{x - b_x}{|x - b_x|} = \eta_{b_x}$ and so

$$\left|\nabla u(x) + \frac{x}{|x|}\right| \leq |\eta_{b_x} + b_x| + \left|\frac{x}{|x|} - b_x\right| \overset{(144),(145)}{\leq} c\beta^{\frac{3}{16}}$$

thus we have established (139). □

Lemma 10. *Let Ω be a convex set and $|\Omega \triangle B_1| \leq \beta$. Define $u(x) = d(x, \partial\Omega)$, note that since u is convex ∇u is BV. Let $V(\nabla u, \cdot)$ denotes the total total variation of the measure ∇u. Firstly we have*

$$V(\nabla u, \Omega \backslash B_{3\beta^{\frac{1}{8}}}(0)) \leq c. \tag{146}$$

Secondly for any $\varepsilon \in (0, \beta^{\frac{1}{2}}]$, for any $x \in \Omega \backslash \left(N_{2\varepsilon}(\partial\Omega) \cup B_{4\beta^{\frac{1}{8}}}(0) \right)$ we have

$$V(\nabla u, B_\varepsilon(x)) \leq c\beta^{\frac{3}{16}}\varepsilon. \tag{147}$$

Proof. Let $\tau \in (0, \varepsilon)$ be some small number. For any $x \in \Omega \backslash (N_{4\tau}(\partial\Omega) \cup B_{\frac{3}{2}\beta^{\frac{1}{8}}}(0)) =: \Pi_\tau$. Let $w_\tau(x) = u * \rho_\tau(x)$ and $v^\tau = \frac{\nabla_x w_\tau}{|\nabla_x w_\tau|}$.

Note from Lemma 9 for any $x \in \Pi_\tau$

$$\begin{aligned}
\left| \nabla w_\tau(x) + \frac{x}{|x|} \right| &= \left| \int \left(\nabla u(x-z) + \frac{x}{|x|} \right) \rho_\tau(z) dz \right| \\
&\leq \int \left| \left(\nabla u(x-z) + \frac{x-z}{|x-z|} \right) \rho_\tau(z) \right| dz + \int \left| \frac{x-z}{|x-z|} - \frac{x}{|x|} \right| \rho_\tau(z) dz \\
&\overset{(139)}{\leq} c \sup_{z \in B_\tau(0)} \left| \frac{x-z}{|x-z|} - \frac{x}{|x|} \right| + c\beta^{\frac{3}{16}} \\
&\leq c\beta^{\frac{3}{16}}.
\end{aligned} \tag{148}$$

From this its easy to conclude that

$$\| w_\tau - dist(\cdot, \partial B_1(0)) \|_{L^\infty(\Pi_\tau)} \leq c\beta^{\frac{3}{16}}. \tag{149}$$

Step 1. We will show that for any $t \in (8\tau, 1 - 2\beta^{\frac{1}{8}})$

$$\int_{w_\tau^{-1}(t)} \left| v^\tau_{1,1}(z) + v^\tau_{2,2}(z) \right| dH^1 z \leq c \tag{150}$$

Proof of Step 1. We define the 'angle' function by

$$A(x) := \begin{cases} \cos^{-1}\left(\frac{x_1}{|x|} \right) & \text{for } x_2 \geq 0 \\ 2\pi - \cos^{-1}\left(\frac{x_1}{|x|} \right) & \text{for } x_2 < 0 \end{cases} \tag{151}$$

Note that A is smooth expect at the half line $\{(x_1, x_2) : x_2 = 0, x_1 > 1\}$. For $x \in \Pi_\tau$ we have $|v^\tau(x)|^2 = 1$, so

$$\partial_1(|v^\tau(x)|^2) = v^\tau_1(x) v^\tau_{1,1}(x) + v^\tau_2(x) v^\tau_{2,1}(x) = 0 \tag{152}$$

and

$$\partial_2(|v^\tau(x)|^2) = v^\tau_1(x) v^\tau_{1,2}(x) + v^\tau_2(x) v^\tau_{2,2}(x) = 0. \tag{153}$$

Since u is the 1-Lipschitz,

$$\| w_\tau - u \|_{L^\infty(\Pi_\tau)} \leq 2\tau, \tag{154}$$

and so from this and (149) we have that for any $t \in (8\tau, 1 - 2\beta^{\frac{1}{8}})$, $w_\tau^{-1}(t) \subset \Pi_\tau$ and hence v^τ is well defined along this level set. We also know that for any $x \in w_\tau^{-1}(t)$ the tangent to curve $w_\tau^{-1}(t)$ is given by $\begin{pmatrix} -v^\tau_2(x) \\ v^\tau_1(x) \end{pmatrix}$.

Now there exists a point $x_0 \in w_\tau^{-1}(t)$ such that $A \begin{pmatrix} -v^\tau_2(x_0) \\ v^\tau_1(x_0) \end{pmatrix} = 0$. Let $\Phi^t : \left[0, H^1(w_\tau^{-1}(t))\right) \to w_\tau^{-1}(t)$ denote that parameterisation of Γ_t by arc-length with $\Phi^t(0) = x_0$, so $\dot{\Phi}^t(s) = \begin{pmatrix} -v^\tau_2(\Phi^t(s)) \\ v^\tau_1(\Phi^t(s)) \end{pmatrix}$.

Define $\Theta_t : [0, H^1(w_\tau^{-1}(t))) \to \mathbb{R}$ by $\Theta_t(s) = A(\dot{\Phi}^t(s))$. Now pick $s \in \left(0, H^1(w_\tau^{-1}(t))\right)$, suppose $v_1^\tau\left(\Phi^t(s)\right) > 0$, then

$$\begin{aligned}
\dot{\Theta}_t(s) &= \dot{\cos}^{-1}\left(-v_2^\tau\left(\Phi^t(s)\right)\right)\frac{\partial}{\partial t}\left(-v_2^\tau\left(\Phi^t(s)\right)\right) \\
&= \dot{\cos}^{-1}\left(-v_2^\tau\left(\Phi^t(s)\right)\right)\left(-v_{2,1}^\tau\left(\Phi^t(s)\right)\dot{\Phi}_1^t(t) - v_{2,2}^\tau\left(\Phi^t(s)\right)\dot{\Phi}_2^t(t)\right) \\
&= \dot{\cos}^{-1}\left(-v_2^\tau\left(\Phi^t(s)\right)\right)\left(v_{2,1}^\tau\left(\Phi^t(s)\right)v_2^\tau\left(\Phi^t(s)\right) - v_{2,2}^\tau\left(\Phi^t(s)\right)v_1^\tau\left(\Phi^t(s)\right)\right) \\
&\overset{(152)}{=} \dot{\cos}^{-1}\left(-v_2^\tau\left(\Phi^t(s)\right)\right)\left(-v_{1,1}^\tau\left(\Phi^t(s)\right)v_1^\tau\left(\Phi^t(s)\right) - v_{2,2}^\tau\left(\Phi^t(s)\right)v_1^\tau\left(\Phi^t(s)\right)\right) \\
&= -\dot{\cos}^{-1}\left(-v_2^\tau\left(\Phi^t(s)\right)\right)v_1^\tau\left(\Phi^t(s)\right)\left(v_{1,1}^\tau\left(\Phi^t(s)\right) + v_{2,2}^\tau\left(\Phi^t(s)\right)\right). \qquad (155)
\end{aligned}$$

Now for any $w \in (-1,1)$, $\dot{\cos}^{-1}(w) = -(\sin(\cos^{-1}(w)))^{-1}$ so

$$\dot{\Theta}_t(t) = \frac{v_1^\tau\left(\Phi^t(s)\right)}{\sin(\cos^{-1}(-v_2^\tau\left(\Phi^t(s)\right)))}\left(v_{1,1}^\tau\left(\Phi^t(s)\right) + v_{2,2}^\tau\left(\Phi^t(s)\right)\right). \qquad (156)$$

Recall $\left|\begin{pmatrix} -v_2^\tau\left(\Phi^t(s)\right) \\ v_1^\tau\left(\Phi^t(s)\right)\end{pmatrix}\right| = 1$ and we supposed $v_1^\tau\left(\Phi^t(s)\right) \geq 0$, so

$$\begin{aligned}
v_1^\tau\left(\Phi^t(s)\right) &= \sqrt{1 - \left(v_2^\tau\left(\Phi^t(s)\right)\right)^2} \\
&= \sqrt{1 - \left(\cos\left(\cos^{-1}\left(-v_2^\tau\left(\Phi^t(s)\right)\right)\right)\right)^2} \\
&= \sin\left(\cos^{-1}\left(-v_2^\tau\left(\Phi^t(s)\right)\right)\right). \qquad (157)
\end{aligned}$$

Thus from (156)

$$\dot{\Theta}_t(s) = \left(v_{1,1}^\tau\left(\Phi^t(s)\right) + v_{2,2}^\tau\left(\Phi^t(s)\right)\right) \text{ for any } s \in \left(0, H^1(w_\tau^{-1}(t))\right) \text{ with } v_1^\tau\left(\Phi^t(s)\right) > 0. \qquad (158)$$

Suppose we have $s \in \left(0, H^1(w_\tau^{-1}(t))\right)$ with $v_1^\tau\left(\Phi^t(s)\right) < 0$, then in the same way as (157) we have

$$v_1^\tau\left(\Phi^t(s)\right) = -\sqrt{1 - \left(\cos\left(\cos^{-1}\left(-v_2^\tau\left(\Phi^t(s)\right)\right)\right)\right)^2} = -\sin\left(\cos^{-1}\left(-v_2^\tau\left(\Phi^t(s)\right)\right)\right). \qquad (159)$$

And since $v_1^\tau(\Phi^t(s)) < 0$, by definition of A (see (151)) arguing as in (156) we have

$$\begin{aligned}
\dot{\Theta}_t(s) &= \frac{-v_1^\tau\left(\Phi^t(s)\right)}{\sin\left(\cos^{-1}\left(-v_2^\tau\left(\Phi^t(s)\right)\right)\right)}\left(v_{1,1}^\tau\left(\Phi^t(s)\right) + v_{2,2}^\tau\left(\Phi^t(s)\right)\right) \\
&\overset{(159)}{=} v_{1,1}^\tau\left(\Phi^t(s)\right) + v_{2,2}^\tau\left(\Phi^t(s)\right) \text{ for } s \in \left(0, H^1(w_\tau^{-1}(t))\right) \text{ with } v_1^\tau\left(\Phi^t(s)\right) < 0.
\end{aligned}$$

Without loss of generality we can assume $\left|\left\{s \in [0, H^1(w_\tau^{-1}(t))] : v_1^\tau\left(\Phi^t(s)\right) = 0\right\}\right| = 0$. Thus by continuity of $\dot{\Theta}_t(\cdot)$, $v_{1,1}^\tau(\Phi^\tau(\cdot))$ and $v_{2,2}^\tau(\Phi^\tau(\cdot))$ we have

$$\dot{\Theta}_t(s) = v_{1,1}^\tau\left(\Phi^t(s)\right) + v_{2,2}^\tau\left(\Phi^t(s)\right) \text{ for } s \in \left[0, H^1(w_\tau^{-1}(t))\right). \qquad (160)$$

Now since u is concave, w_τ is concave and so the set $w_\tau^{-1}([t,\infty))$ is a convex set, hence

$$v_{1,1}^\tau\left(\Phi^t(s)\right) + v_{2,2}^\tau\left(\Phi^t(s)\right) = \dot{\Theta}_t(s) \geq 0 \text{ for any } s \in \left[0, H^1(w_\tau^{-1}(t))\right). \qquad (161)$$

Hence

$$\int_{w_\tau^{-1}(t)} \left|v_{1,1}^\tau(z) + v_{2,2}^\tau(z)\right| dH^1 z = \int_0^{H^1(w_\tau^{-1}(t))} \dot{\Theta}_t(s) ds \leq c$$

Step 2. Let $x \in \Pi_\tau$ and define

$$t_1 = \inf\left\{s \in \mathbb{R} : w_\tau^{-1}(s) \cap B_\varepsilon(x) \neq \emptyset\right\} \text{ and } t_2 = \sup\left\{s \in \mathbb{R} : w_\tau^{-1}(s) \cap B_\varepsilon(x) \neq \emptyset\right\}. \qquad (162)$$

For any $t \in (t_1, t_2)$

$$\sup\left\{\Theta_t(s_1) - \Theta_t(s_2) : \Phi^t(s_1), \Phi^t(s_2) \in B_\varepsilon(x)\right\} \leq c\beta^{\frac{3}{16}}. \qquad (163)$$

Proof of Step 2. Let $s_1, s_2 \in \left[0, H^1(w_\tau^{-1}(t))\right)$ such that $\Phi^t(s_1), \Phi^t(s_2) \in B_\varepsilon(x)$, since Φ^t is parameterization of Γ_t by arclength $\dot{\Phi}^t(s)$ is the unit tangent to $w_\tau^{-1}(t)$ at $\Phi^t(s)$. Thus

$$R\left(\frac{\nabla w_\tau\left(\Phi^t(s_i)\right)}{\left|\nabla w_\tau\left(\Phi^t(s_i)\right)\right|}\right) = \dot{\Phi}^t(s_i) \text{ for } i = 1, 2.$$

However by Lemma 9 (recalling the fact that $|\Phi^t(s_1)| > \frac{3\beta^{\frac{1}{8}}}{2}$ and $|\Phi^t(s_2)| > \frac{3\beta^{\frac{1}{8}}}{2}$ in order to apply the lemma)

$$\begin{aligned}\left|\nabla w_\tau\left(\Phi^t(s_1)\right) - \nabla w_\tau\left(\Phi^t(s_2)\right)\right| &= \left|\int \left(\nabla u\left(\Phi^t\left(s_1\right) - z\right) - \nabla u\left(\Phi^t\left(s_2\right) - z\right)\right)\rho_\tau(z)dz\right| \\ &\overset{(139)}{\leq} c\int_{B_\tau(0)}\left|\frac{\Phi^t(s_1)-z}{|\Phi^t(s_1)-z|} - \frac{\Phi^t(s_2)-z}{|\Phi^t(s_2)-z|}\right|\rho_\tau(z)dz + c\beta^{\frac{3}{16}}.\end{aligned} \tag{164}$$

Note $z \in B_\tau(0) \subset B_{\beta^{\frac{1}{2}}}(0)$ so as $x \notin B_{2\beta^{\frac{1}{8}}}(0)$ we have $|\Phi^t(s_1) - z| \geq |\Phi^t(s_1)| - |z| \geq \beta^{\frac{1}{8}}$. Recall the elementary inequality inequality

$$\left|\frac{z}{|z|} - \frac{y}{|y|}\right| \leq 2\,|z-y| \text{ for any } z, y \text{ with } |z| \geq 1, |y| \geq 1. \tag{165}$$

So in particular we have

$$\left|\left|\frac{\Phi^t(s_1)-z}{|\Phi^t(s_1)-z|} - \frac{\Phi^t(s_2)-z}{|\Phi^t(s_2)-z|}\right|\right| \leq \frac{2}{\beta^{\frac{1}{8}}}\left|\Phi^t(s_1) - \Phi^t(s_2)\right| \leq 2\beta^{\frac{3}{8}}. \tag{166}$$

So with (164) this gives

$$\left|\nabla w_\tau\left(\Phi^t(s_1)\right) - \nabla w_\tau\left(\Phi^t(s_2)\right)\right| \leq c\beta^{\frac{3}{16}}. \tag{167}$$

Recall as a consequence of (148) we know

$$||\nabla w_\tau(x)| - 1| \leq c\beta^{\frac{3}{16}} \text{ for any } x \in \Pi_\tau \tag{168}$$

so

$$\begin{aligned}\left|\dot{\Phi}(s_1) - \dot{\Phi}(s_2)\right| &\overset{(167)}{\leq} \left|R\left(\frac{\nabla w_\tau\left(\Phi^t(s_1)\right)}{\left|\nabla w_\tau\left(\Phi^t(s_1)\right)\right|}\right) - R\left(\nabla w_\tau\left(\Phi^t(s_1)\right)\right)\right| \\ &\quad + \left|R\left(\frac{\nabla w_\tau\left(\Phi^t(s_2)\right)}{\left|\nabla w_\tau\left(\Phi^t(s_2)\right)\right|}\right) - R\left(\nabla w_\tau\left(\Phi^t(s_2)\right)\right)\right| + c\beta^{\frac{3}{16}} \\ &\overset{(168)}{\leq} c\beta^{\frac{3}{16}}.\end{aligned} \tag{169}$$

Thus

$$|\Theta_t(s_1) - \Theta_t(s_2)| = \left|A\left(\dot{\Phi}^t(s_1)\right) - A\left(\dot{\Phi}^t(s_2)\right)\right| \overset{(169)}{\leq} c\beta^{\frac{3}{16}} \tag{170}$$

and so (163) is established.

Proof of Lemma completed. For any $t \in (t_1, t_2)$. Let $s_1^t = \inf\{s : \Phi^t(s) \in B_\varepsilon(x)\}$, $s_2^t = \sup\{s : \Phi^t(s) \in B_\varepsilon(x)\}$. So $[s_1^t, s_2^t] = \{s : \Phi^t(s) \in B_\varepsilon(x)\}$. Now

$$\begin{aligned}\int_{\left[s_1^t, s_2^t\right]}\left|v_{1,1}^\tau(\Phi^t(s)) + v_{1,1}^\tau(\dot{\Phi}_t(s))\right|ds &\overset{(161)}{=} \int_{\left[s_1^t, s_2^t\right]}\dot{\Theta}_t(s)ds \\ &\overset{(170)}{\leq} c\beta^{\frac{3}{16}}.\end{aligned} \tag{171}$$

Thus

$$\begin{aligned}\int_{B_\varepsilon(x)} \left|v^\tau_{1,1}(z)+v^\tau_{1,1}(z)\right| |\nabla w_\tau(z)|\, dz &= \int_{t_1}^{t_2}\int_{w_\tau^{-1}(t)} \left|v^\tau_{1,1}(z)+v^\tau_{1,1}(z)\right| dH^1 z dt \\ &= \int_{t_1}^{t_2}\int_{\left[s_1^t, s_2^t\right]} \left|v^\tau_{1,1}(\Phi^t(s))+v^\tau_{1,1}(\Phi^t(s))\right| ds dt \\ &\overset{(171)}{\leq} c\,|t_1-t_2|\,\beta^{\frac{3}{16}}.\end{aligned}$$

By using (148) and recalling the definition (162) of Step 2 we must have $|t_1-t_2|\leq c\varepsilon$. Also from (148) we know $|\nabla w_\tau(z)|\geq 1-c\beta^{\frac{3}{16}}$ for all $z\in B_\varepsilon(x)$, so putting these things together we have

$$\int_{B_\varepsilon(x)} \left|v^\tau_{1,1}(z)+v^\tau_{1,1}(z)\right| dz \leq c\varepsilon\beta^{\frac{3}{16}}. \tag{172}$$

Since $v^\tau_{2,1}=v^\tau_{1,2}$ we have

$$\begin{pmatrix} v^\tau_{1,1} & v^\tau_{2,1}\\ v^\tau_{2,1} & v^\tau_{2,2}\end{pmatrix}\begin{pmatrix} v^\tau_1\\ v^\tau_2\end{pmatrix} \overset{(152),(153)}{=} \begin{pmatrix}0\\0\end{pmatrix} \text{ and } \begin{pmatrix} v^\tau_{1,1} & v^\tau_{2,1}\\ v^\tau_{2,1} & v^\tau_{2,2}\end{pmatrix}\begin{pmatrix} -v^\tau_2\\ v^\tau_1\end{pmatrix} \overset{(152),(153)}{=} (v^\tau_{1,1}+v^\tau_{2,2})\begin{pmatrix} -v^\tau_2\\ v^\tau_1\end{pmatrix}.$$

Letting $\|\cdot\|$ denote the operator norm of a matrix, since $\begin{pmatrix} v^\tau_1 & -v^\tau_2\\ v^\tau_2 & v^\tau_1\end{pmatrix}\in O(2)$ thus

$$\begin{aligned}\left\|\begin{pmatrix} v^\tau_{1,1} & v^\tau_{2,1}\\ v^\tau_{2,1} & v^\tau_{2,2}\end{pmatrix}\right\| &= \left\|\begin{pmatrix} v^\tau_{1,1} & v^\tau_{2,1}\\ v^\tau_{2,1} & v^\tau_{2,2}\end{pmatrix}\begin{pmatrix} v^\tau_1 & -v^\tau_2\\ v^\tau_2 & v^\tau_1\end{pmatrix}\right\| \\ &= \left\|\begin{pmatrix} 0 & -(v^\tau_{1,1}+v^\tau_{2,2})v^\tau_2\\ 0 & (v^\tau_{1,1}+v^\tau_{2,2})v^\tau_1\end{pmatrix}\right\| \\ &\leq c\left|v^\tau_{1,1}+v^\tau_{2,2}\right|\end{aligned}$$

As the operator norm and Euclidean norm are equivalent $|Dv^\tau|\leq c\left|v^\tau_{1,1}+v^\tau_{2,2}\right|$. Hence from (172)

$$\int_{B_\varepsilon(x)} |Dv^\tau| \leq c\beta^{\frac{3}{16}}\varepsilon. \tag{173}$$

Additionally for any $t\in(8\tau, 1-2\beta^{\frac{1}{8}})$, we have $\int_{w_\tau^{-1}(t)}|Dv^\tau|\,dH^1 z \overset{(150)}{\leq} c$. Note that by (149) and (154) we have $\Pi_{16\tau}\backslash B_{3\beta^{\frac{1}{8}}}(0)\subset w_\tau^{-1}\left(\left[8\tau, 1-2\beta^{\frac{1}{8}}\right]\right)$ by using the Co-area formula

$$\int_{\Pi_{16\tau}\backslash B_{3\beta^{\frac{1}{8}}}(0)} |Dv^\tau|\,|\nabla w^\tau| \leq \int_{8\tau}^{1-2\beta^{\frac{1}{8}}}\int_{w_\tau^{-1}(s)} |Dv^\tau|\, dH^1 z ds \leq c.$$

Thus using (148)

$$\int_{\Pi_{8\tau}\backslash B_{3\beta^{\frac{1}{8}}}(0)} |Dv^\tau| \leq c \tag{174}$$

Let $\tau_n = 2^{-n}$. So given $x\in\Omega\backslash\left(N_{2\varepsilon}(\partial\Omega)\cup B_{4\beta^{\frac{1}{8}}}(0)\right)$ by definition of w_{τ_n} we know $\nabla w_{\tau_n}\overset{L^1}{\to}\nabla u$ and so

$$\begin{aligned}\int_{B_\varepsilon(x)} |1-|\nabla w_{\tau_n}|| &= \int_{B_\varepsilon(x)} ||\nabla u|-|\nabla w_{\tau_n}|| \\ &\leq \int_{B_\varepsilon(x)} |\nabla u-\nabla w_{\tau_n}| \to 0 \text{ as } n\to\infty.\end{aligned}$$

So we have

$$\begin{aligned}\|v^{\tau_n}-\nabla u\|_{L^1(B_\varepsilon(x))} &\leq \| \left|\nabla w^{\tau_n}\right|^{-1}\nabla w_{\tau_n}-\nabla w_{\tau_n}\|_{L^1(B_\varepsilon(x))}+\|\nabla w_{\tau_n}-\nabla u\|_{L^1(B_\varepsilon(x))}\\ &\to 0 \text{ as } n\to\infty. \end{aligned} \tag{175}$$

Also as by (173) the sequence v^{τ_n} is bounded in BV and by (175) is converging in L^1 to u, by Proposition 3.13 [Am-Fu-Pa 00] we have that

$$v^{\tau_n} \overset{BV(B_\varepsilon(x))}{\rightharpoonup} \nabla u.$$

Hence by Remark 3.5 [Am-Fu-Pa 00] total variation is lower semicontinuous with respect to weak convergence we have $V(\nabla u, B_\varepsilon(x)) \leq c\beta^{\frac{3}{16}}\varepsilon$. By arguing in exactly the same way we see (174) implies $V(\Omega\backslash B_{3\beta^{\frac{1}{8}}}(0)) \leq c$. □

Lemma 11. *Let Ω be a convex domain and $|\Omega\triangle B_1(0)| \leq \beta$. Let $u(x) = d(x,\partial\Omega)$ and for $\varepsilon \in (0, \frac{\beta^{\frac{1}{2}}}{4}]$ define $u_\varepsilon := u * \rho_\varepsilon$. For any a for which $a \in \Omega\backslash\left(N_{8\varepsilon}(\partial\Omega)\cup B_{4\beta^{\frac{1}{8}}}(0)\right)$ we have*

$$||\nabla u_\varepsilon(x)|-1| \leq c\varepsilon^{-1}V(\nabla u, B_{4\varepsilon}(a)) \text{ for any } x \in B_{2\varepsilon}(a). \tag{176}$$

Proof. Firstly recall that since u is concave and hence ∇u is BV, so by Poincare's inequality

$$\left(\int_{B_{4\varepsilon}(a)} |\nabla u - w|^2\right)^{\frac{1}{2}} \leq cV\left(\nabla u, B_{4\varepsilon}(a)\right), \tag{177}$$

we have $w = \fint_{B_{4\varepsilon}(a)} \nabla u$. Using Holder's inequality we get another form of Poincare's inequality

$$\int_{B_{4\varepsilon}(a)} |\nabla u - w| \leq c\|\nabla u - w\|_{L^2(B_{4\varepsilon}(a))}\varepsilon \leq c\varepsilon V\left(\nabla u, B_{4\varepsilon}(a)\right). \tag{178}$$

Now

$$\begin{aligned}\pi 16\varepsilon^2\left|1-|w|\right| &= \int_{B_{4\varepsilon}(a)} |1-|w||\\ &= \int_{B_{4\varepsilon}(a)} ||\nabla u|-|w||\\ &\overset{(178)}{\leq} c\varepsilon V(\nabla u, B_{4\varepsilon}(a)).\end{aligned}$$

Thus $|1-|w|| \leq c\frac{V(\nabla u, B_{4\varepsilon}(a))}{\varepsilon}$ and so there must exists $v \in S^1$ such that $|v-w| \leq |1-|w||$ hence putting this together with (178) we have

$$\fint_{B_{4\varepsilon}(a)} |\nabla u - v| \leq c\frac{V(\nabla u, B_{4\varepsilon}(a))}{\varepsilon}. \tag{179}$$

Hence for any $w \in B_{2\varepsilon}(a)$, using Lemma 10 for the last inequality

$$\begin{aligned}|\nabla u_\varepsilon(w) - v| &= \left|\int \left(\nabla u(z) - v\right)\rho_\varepsilon(w-z)dz\right|\\ &\leq c\varepsilon^{-2}\left|\int \left(\nabla u(z)-v\right)\rho(\varepsilon^{-1}(z-w))dz\right|\\ &\leq c\varepsilon^{-2}\int_{B_{2\varepsilon}(w)} |\nabla u(z) - v|\,dz\\ &\overset{(179)}{\leq} c\frac{V(\nabla u, B_{4\varepsilon}(a))}{\varepsilon}.\end{aligned} \tag{180}$$

This completes the proof of Lemma 11. □

Lemma 12. *Let Ω be a convex domain and $|\Omega \triangle B_1(0)| \leq \beta$. Let $u(x) = d(x, \partial\Omega)$ and define $u_\varepsilon := u * \rho_\varepsilon$. Define $\Lambda := \Omega \backslash \left(N_{8\varepsilon}(\partial\Omega) \cup B_{4\beta^{\frac{1}{8}}}(0) \right)$, we will show that for any $\varepsilon \in (0, \frac{\beta^{\frac{1}{2}}}{4}]$*

$$\int_\Lambda \varepsilon^{-1} \left| 1 - |\nabla u_\varepsilon|^2 \right|^2 + \varepsilon \left| \nabla^2 u_\varepsilon \right|^2 \leq c\beta^{\frac{3}{16}}. \tag{181}$$

Proof of Lemma. By the 5r Covering Theorem ([Ma 95], Theorem 2.1) them we can find a finite collection of balls $J := \left\{ B_{\frac{2\varepsilon}{5}}(x_i) : i = 1, 2, \dots m \right\}$ that are piecewise disjoint and $\Lambda \subset \bigcup_{i=1}^m B_{2\varepsilon}(x_i)$.

Note that for any $i = 1, 2, \dots n$ since they are pairwise disjoint there are at most C_1 balls from J inside $B_{5\varepsilon}(x_i)$. Thus $\| \sum_{i=1}^m \mathbb{1}_{B_{5\varepsilon}(x_i)} \|_{L^\infty(\Omega)} \leq C_1$ and this obviously implies $\| \sum_{i=1}^m \mathbb{1}_{B_{2\varepsilon}(x_i)} \|_{L^\infty(\Omega)} \leq C_1$.

For $x, y \in \mathbb{R}^2$ let $x \otimes y := \left(\begin{smallmatrix} x_1 y_1 & x_1 y_2 \\ x_2 y_1 & x_2 y_2 \end{smallmatrix} \right)$. Now given $a \in \Lambda$ if $x \in B_{2\varepsilon}(a)$, let $w = \fint_{B_\varepsilon(x)} \nabla u$

$$\begin{aligned}
\left| \nabla^2 u_\varepsilon(x) \right| &= \left| \int \nabla u(z) \otimes \nabla \rho_\varepsilon(x - z) dz \right| \\
&\leq \left| \int (\nabla u(z) - w) \otimes \nabla \rho \left(\frac{x - z}{\varepsilon} \right) \varepsilon^{-3} dz \right| \\
&\leq c\varepsilon^{-3} \left| \int_{B_\varepsilon(x)} (\nabla u - w) dz \right| \\
&\overset{(178)}{\leq} c\varepsilon^{-2} V(\nabla u, B_{4\varepsilon}(a)).
\end{aligned} \tag{182}$$

So

$$\begin{aligned}
\int_\Lambda \left| \nabla^2 u_\varepsilon \right|^2 dx &\leq \sum_{i=1}^m c \int_{B_{2\varepsilon}(x_i)} \left| \nabla^2 u_\varepsilon \right|^2 dx \\
&\leq c \sum_{i=1}^m \varepsilon^2 \| \nabla^2 u_\varepsilon \|^2_{L^\infty(B_{2\varepsilon}(x_i))} \\
&\overset{(182)}{\leq} c\varepsilon^2 \left(\sum_{i=1}^m \varepsilon^{-4} \left(V(\nabla u, B_{4\varepsilon}(x_i)) \right)^2 \right) \\
&\overset{(147)}{\leq} c\beta^{\frac{3}{16}} \varepsilon^{-1} \left(\sum_{i=1}^m V(\nabla u, B_{4\varepsilon}(x_i)) \right) \\
&\leq c\beta^{\frac{3}{16}} \varepsilon^{-1} V(\nabla u, \Lambda) \\
&\overset{(146)}{\leq} c\varepsilon^{-1} \beta^{\frac{3}{16}}.
\end{aligned} \tag{183}$$

Now

$$\begin{aligned}\int_\Lambda \left|1-|\nabla u_\varepsilon|^2\right|^2 dz &\leq c\sum_{i=1}^m \int_{B_{2\varepsilon}(x_i)} |1-|\nabla u_\varepsilon||^2\, dz\\ &\overset{(147),(176)}{\leq} \sum_{i=1}^m c\varepsilon^2\beta^{\frac{3}{16}} \| \, |1-|\nabla u_\varepsilon|| \, \|_{L^\infty(B_{2\varepsilon}(x_i))}\\ &\overset{(176)}{\leq} \sum_{i=1}^m c\varepsilon\beta^{\frac{3}{16}} V(\nabla u, B_{4\varepsilon}(x_i))\\ &\leq c\varepsilon\beta^{\frac{3}{16}} V(\nabla u, \Omega\backslash B_{2\beta^{\frac{1}{8}}}(0))\\ &\overset{(146)}{\leq} c\beta^{\frac{3}{16}}\varepsilon. \end{aligned} \tag{184}$$

Putting (184) together with (183) establishes (181). □

Lemma 13. *Let $\eta(x)=|x|$, $\varepsilon>0$ and define $\eta_\varepsilon(x) := \int \eta(z)\rho_\varepsilon(x-z)dz$. So*

$$\int_{B_1(0)\backslash B_{2\varepsilon}(0)} \left|1-|\nabla\eta_\varepsilon|^2\right|^2 dz \leq c\log(\varepsilon^{-1})\varepsilon^2 \tag{185}$$

and

$$\int_{B_1(0)\backslash B_{2\varepsilon}(0)} \left|\nabla^2\eta_\varepsilon\right|^2 dz \leq c\log(\varepsilon^{-1}). \tag{186}$$

Proof of Lemma. Note for $x\notin B_{2\varepsilon}(0)$, $z\in B_\varepsilon(x)$

$$\begin{aligned}\left|\frac{z}{|z|}-\frac{x}{|x|}\right| &\leq \left|\frac{z\,|x|-x\,|z|}{|z|\,|x|}\right|\\ &\leq \left|\frac{z\,|x|-x\,|x|}{|z|\,|x|}\right| + \left|\frac{x\,|x|-x\,|z|}{|z|\,|x|}\right|\\ &\leq \frac{c\varepsilon}{|x|-\varepsilon}. \end{aligned} \tag{187}$$

So for $x\notin B_{2\varepsilon}(0)$

$$\begin{aligned}\left|\nabla\eta_\varepsilon(x)-\frac{x}{|x|}\right| &= \left|\int \rho_\varepsilon(x-z)\left(\frac{x}{|x|}-\frac{z}{|z|}\right)dz\right|\\ &\overset{(187)}{\leq} \frac{c\varepsilon}{|x|-\varepsilon}. \end{aligned} \tag{188}$$

Since $\int \frac{x}{|x|}\otimes\nabla\rho_\varepsilon(x-z)dz=0$, for any $x\notin B_{2\varepsilon}(0)$

$$\begin{aligned}\nabla^2\eta_\varepsilon(x) &= \left|\int \nabla\eta_\varepsilon(z)\otimes\nabla\rho_\varepsilon(x-z)dz\right|\\ &= \left|\int\left(\nabla\eta_\varepsilon(z)-\frac{z}{|z|}\right)\otimes\nabla\rho_\varepsilon(x-z)dz\right| + \left|\int\left(\frac{x}{|x|}-\frac{z}{|z|}\right)\otimes\nabla\rho_\varepsilon(x-z)dz\right|\\ &\overset{(187),(188)}{\leq} \frac{c\varepsilon}{|x|-\varepsilon}\left|\int\nabla\rho_\varepsilon(x-z)dz\right|\\ &\leq \frac{c}{|x|-\varepsilon}. \end{aligned} \tag{189}$$

Hence

$$\begin{aligned}\int_{B_1(0)\setminus B_{2\varepsilon}(0)} \left|\nabla^2 \eta_\varepsilon(x)\right|^2 dx &= c\int_{2\varepsilon}^1 \int_{\partial B_h(0)} \left(\frac{1}{|z|-\varepsilon}\right)^2 dH^1 z dr \\ &\leq c\int_\varepsilon^1 \frac{1}{r} dr \\ &\leq c\log(\varepsilon^{-1}) \end{aligned} \tag{190}$$

which establish (186).

Note $\left||\nabla \eta_\varepsilon(x)|-1\right|^2 \leq \left|\nabla \eta_\varepsilon(x) - \frac{x}{|x|}\right|^2 \overset{(188)}{\leq} c\frac{\epsilon^2}{(|x|-\epsilon)^2}$ so arguing in the same way as in (190) we have (185). □

Lemma 14. *Let Ω be a convex domain and $|\Omega \triangle B_1(0)| \leq \beta$.*

Let $u(x) = d(x, \partial\Omega)$ and $\eta(x) = 1 - 10\beta^{\frac{3}{32}} + |x|$. Define $\Gamma := \{x : u(x) = \eta(x)\}$, we will show Γ is the boundary of a convex set with $H^1(\Gamma) \leq c\beta^{\frac{3}{32}}$,

$$\Gamma \subset N_{c\beta^{\frac{3}{16}}}(\partial B_{5\beta^{\frac{3}{32}}}(0)) \tag{191}$$

and for any $\varepsilon \in (0, \beta^{\frac{3}{16}}]$

$$|N_{2\varepsilon}(\Gamma)| \leq c\varepsilon\beta^{\frac{3}{32}}. \tag{192}$$

Proof of Lemma.

Step 1. We will show $\Pi := \{x \in \Omega : \eta(x) \leq u(x)\}$ is convex.

Proof of Step 1. Take $a, b \in \Pi$ and pick $\lambda \in [0,1]$. Since u is concave $u(\lambda a + (1-\lambda)b) \geq \lambda u(a) + (1-\lambda)u(b)$ and since η is convex $\eta(\lambda a + (1-\lambda)b) \leq \lambda\eta(a) + (1-\lambda)\eta(b)$. Hence as $a, b \in \Pi$, $u(\lambda a + (1-\lambda)b) \geq \eta(\lambda a + (1-\lambda)b)$. Thus $[a,b] \subset \Pi$ and thus the set Π is convex.

Step 2. We will establish (191).

Proof of Step 2. Let $x \in \Gamma$ and let $b_x \in \partial\Omega$ be such that $|x - b_x| = u(x)$. So

$$1 - 10\beta^{\frac{3}{32}} + |x| = |b_x - x|. \tag{193}$$

And thus $1 - 10\beta^{\frac{3}{32}} + |x| \geq |b_x| - |x|$, so using (110)

$$2|x| \geq |b_x| - 1 + 10\beta^{\frac{3}{32}} \geq 10\beta^{\frac{3}{32}} - c\sqrt{\beta}. \tag{194}$$

Also from (193) we have

$$|x| = |b_x - x| - (1 - 10\beta^{\frac{3}{32}}) \overset{(110)}{\leq} 10\beta^{\frac{3}{32}} + \sqrt{\beta}. \tag{195}$$

Now using Lemma 9, since $\nabla u(x) = \frac{x - b_x}{|x - b_x|}$ so

$$\begin{aligned}\left|\frac{x}{|x|} - \frac{b_x}{|b_x|}\right| &\leq \left|\frac{b_x - x}{|b_x - x|} - \frac{b_x}{|b_x|}\right| + \left|\frac{x - b_x}{|x - b_x|} + \frac{x}{|x|}\right| \\ &\overset{(195),(139)}{\leq} c\beta^{\frac{3}{32}} \end{aligned} \tag{196}$$

so

$$\left|1 - \frac{b_x}{|b_x|} \cdot \frac{x}{|x|}\right| = 2^{-1}\left|\frac{b_x}{|b_x|} - \frac{x}{|x|}\right|^2 \leq c\beta^{\frac{3}{16}}. \tag{197}$$

Again by Lemma 9 we have

$$\begin{aligned}\left||b_x - x| + (x - b_x)\cdot\frac{x}{|x|}\right| &\leq |x - b_x|\left|\frac{x - b_x}{|x - b_x|} + \frac{x}{|x|}\right| \\ &\leq 2\left|\nabla u(x) + \frac{x}{|x|}\right| \\ &\overset{(139)}{\leq} c\beta^{\frac{3}{16}} \end{aligned} \tag{198}$$

and thus

$$\begin{aligned}\left|2x\cdot\frac{x}{|x|} - 10\beta^{\frac{3}{32}}\right| &\overset{(197)}{\leq} \left|-10\beta^{\frac{3}{32}} + 1 - \frac{b_x}{|b_x|}\cdot\frac{x}{|x|} + 2x\cdot\frac{x}{|x|}\right| + c\beta^{\frac{3}{16}} \\ &= \left|1 - 10\beta^{\frac{3}{32}} + |x| - \left(\frac{b_x}{|b_x|} - x\right)\cdot\frac{x}{|x|}\right| + c\beta^{\frac{3}{16}} \\ &\overset{(193)}{=} \left||b_x - x| - \left(\frac{b_x}{|b_x|} - x\right)\cdot\frac{x}{|x|}\right| + c\beta^{\frac{3}{16}} \\ &\leq \left||b_x - x| + (x - b_x)\cdot\frac{x}{|x|}\right| + c\beta^{\frac{3}{16}} \\ &\overset{(198)}{\leq} c\beta^{\frac{3}{16}}\end{aligned}$$

hence $\left|2|x| - 10\beta^{\frac{3}{32}}\right| \leq c\beta^{\frac{3}{16}}$ for any $x \in \Gamma$, so (191) is established.

Since (191) implies the diameter of Π is bounded by $c\beta^{\frac{3}{32}}$ and since Π is a convex set it follows immediately that $H^1(\Gamma) \leq c\beta^{\frac{3}{32}}$.

Now the set Γ equipped with the Euclidean norm is a boundly compact metric space. So by applying the 5r Covering Theorem (Theorem 2.1 [Ma 95]) we can find a disjoint collection of balls $B_{2\varepsilon}(x_1), B_{2\varepsilon}(x_2), \dots B_{2\varepsilon}(x_M)$ with $x_1, x_2, \dots x_M \in \Gamma$ such that $\partial\Omega \subset \bigcup_{i=1}^M B_{10\varepsilon}(x_i)$. This implies $N_{2\epsilon}(\partial\Omega) \subset \bigcup_{i=1}^M B_{20\varepsilon}(x_i)$. Since $H^1(\Gamma) \leq c\beta^{\frac{3}{32}}$ so $M \leq c\epsilon^{-1}\beta^{\frac{3}{32}}$ and thus $|N_{2\varepsilon}(\Gamma)| \leq c\epsilon\beta^{\frac{3}{32}}$ which establishes (192). □

4.2. **Proof of Proposition 1.** Let $u(x) = d(x, \partial\Omega)$, let $w : \mathbb{R}_+ \to \mathbb{R}_+$ be the smooth monotonic function from the proof of Lemma 8, so w satisfies (116) and $\sup|\ddot{w}| \leq c\epsilon^{-1}$ as in Lemma 8 for $x \in N_\epsilon(\partial\Omega) \cap \Omega$ define $\phi(x) = w(u(x))$. Let

$$v(x) := \min\left\{u(x), 1 - 10\beta^{\frac{3}{32}} + |x|\right\}. \tag{199}$$

and define

$$\xi(x) = \int v(x - z)\rho_{\phi(x)}(z)dz. \tag{200}$$

Let $\Pi = \left\{x : u(x) > 1 - 10\beta^{\frac{3}{32}} + |x|\right\}$, and define $\Lambda_0 = \Omega\backslash(N_\epsilon(\partial\Omega) \cup N_\epsilon(\Pi))$, note that $\xi(x) = u_\epsilon(x)$ for any $x \in \Lambda_0$.

Recall the function ψ defined in Lemma 8, note that $\xi(x) = \psi(x)$ for any $x \in N_\epsilon(\partial\Omega) \cap \Omega$ thus

$$\int_{N_\epsilon(\partial\Omega)\cap\Omega} \epsilon^{-1}\left|1 - |\nabla\xi|^2\right|^2 + \epsilon\left|\nabla^2\xi\right|^2 \overset{(112),(113)}{\leq} c\epsilon$$

Since $\psi = u_\epsilon$ in Λ_0, from (181) we have $\int_{\Lambda_0} \epsilon^{-1}\left|1 - |\nabla\xi|^2\right|^2 + \epsilon\left|\nabla^2\xi\right|^2 \leq c\beta^{\frac{3}{16}}$ and so putting this two inequalities together we have

$$\int_{\Omega\backslash N_\epsilon(\Pi)} \epsilon^{-1}\left|1 - |\nabla\xi|^2\right|^2 + \epsilon\left|\nabla^2\xi\right|^2 \leq c\beta^{\frac{3}{16}} \tag{201}$$

Now as for any $x \in \Pi \backslash N_\epsilon(\partial\Pi)$, $w(x) = 1 - 10\beta^{\frac{3}{32}} + |x|$ and so $u_\epsilon(x) = \eta_\epsilon(x) + (1 - 10\beta^{\frac{3}{32}})$ where $\eta(x) = |x|$ and $\eta_\epsilon = \eta * \rho_\epsilon$. So $\nabla\xi(x) = \nabla\eta_\epsilon(x)$ and $\nabla^2\xi(x) = \nabla^2\eta_\epsilon(x)$ thus applying Lemma 13 we have

$$\int_{\Pi\backslash N_\epsilon(\partial\Pi)} \epsilon^{-1}\left|1 - |\nabla\xi|^2\right|^2 + \epsilon\left|\nabla^2\xi\right|^2 \overset{(185),(186)}{\leq} c\epsilon\log(\epsilon^{-1}). \tag{202}$$

Since v is Lipschitz, so ξ is Lipschitz and so from (192) we have

$$\int_{N_\epsilon(\partial\Pi)} \epsilon^{-1}\left|1 - |\nabla\xi|^2\right|^2 \leq c\beta^{\frac{3}{32}}. \tag{203}$$

And note for any $x \in \Omega\backslash N_\epsilon(\partial\Omega)$

$$\left|\nabla^2\xi(x)\right| = \epsilon^{-3}\left|\int \nabla v(z)\cdot\nabla\rho\left(\frac{x-z}{\epsilon}\right)dz\right| \leq c\epsilon^{-1}$$

so

$$\begin{aligned}\int_{N_\epsilon(\partial\Pi)} \epsilon\left|\nabla^2\xi\right|^2 &\leq c\epsilon^{-1}\left|N_\epsilon(\partial\Pi)\right| \\ &\overset{(192)}{\leq} c\beta^{\frac{3}{32}}.\end{aligned} \tag{204}$$

Putting these inequalities together we have

$$\int_{N_\epsilon(\partial\Pi)} \epsilon^{-1}\left|1 - |\nabla\xi|^2\right|^2 + \epsilon\left|\nabla^2\xi\right|^2 \leq c\beta^{\frac{3}{32}}. \tag{205}$$

Now inequalities (201), (202) and (205) give us that ξ satisfies (107). And since $\xi(x) = \psi(x)$ on $N_\epsilon(\partial\Omega)\cap\Omega$ from (115) satisfies $\nabla\xi(x)\cdot\eta_x = 1$ for any $x \in \partial\Omega$. This completes the proof of Proposition 1. □

4.3. **Proof Corollary 1.** Let $\alpha = \inf_y |\Omega\triangle B_1(y)|$, without loss of generality assume $|\Omega\triangle B_1(0)| = \alpha$. Let $\beta = 4(\alpha+\epsilon)$, note that $\epsilon \in (0, \frac{\beta^{\frac{1}{2}}}{4})$ and $|\Omega\triangle B_1(0)| \leq \beta$.

Since $\xi \in \Lambda(\Omega)$ from (107) we have that $\inf_{u\in\Lambda(\Omega)} I_\epsilon(u) \leq c\beta^{\frac{3}{16}}$. Let $v \in \Lambda(\Omega)$ be the minimiser of I_ϵ and since v satisfies

$$\int_\Omega \left|1 - |\nabla v|^2\right|\left|\nabla^2 v\right| dz \leq \int_\Omega \epsilon^{-1}\left|1 - |\nabla v|^2\right|^2 + \epsilon\left|\nabla^2 v\right|^2 \leq c\beta^{\frac{3}{32}}$$

and as $\epsilon \in (0, \frac{\beta^{\frac{1}{2}}}{4}]$

$$\int_\Omega \left|1 - |\nabla v|^2\right|^2 dz \leq c\beta^{\frac{11}{16}}. \tag{206}$$

So defining $\tilde{\beta} = \beta^{\frac{3}{32}}$, we have that (6), (7) are satisfied and hence by Theorem 2

$$\int_\Omega \left|\nabla v(z) + \frac{z}{|z|}\right|^2 dz \leq c\tilde{\beta}^{\frac{1}{256}} = c\beta^{\frac{3}{32\times 256}}.$$

Applying Lemma 9 we have

$$\int_{\Omega\backslash B_{\beta^{\frac{1}{8}}}(0)} |\nabla v - \nabla\zeta|^2 \leq c\beta^{\frac{3}{32\times 256}}. \tag{207}$$

Now

$$\begin{aligned}\int_{B_{\beta^{\frac{1}{8}}}(0)} |\nabla v - \nabla\zeta|^2\, dz &\leq \int_{B_{\beta^{\frac{1}{8}}}(0)} |\nabla v|^2 + 2\,|\nabla v| + 1 dz \\ &\leq \int_{B_{\beta^{\frac{1}{8}}}(0)} \left(\left|1 - |\nabla v|^2\right| + c\right) dz \\ &\overset{(206)}{\leq} c\beta^{\frac{1}{4}}\end{aligned}$$

together with (207) this gives $\|v-\zeta\|_{W^{2,2}(\Omega)} \leq c\beta^{\frac{3}{8192}} \leq c(\epsilon+\alpha)^{\frac{3}{8192}}$. □
